† Crude odds ratio was calculated by Poisson analysis; ‡ Adjusted odds ratio was calculated by Poisson analysis after adjusting for sex, age and smoking; § Adjusted odds ratio was calculated by Poisson analysis after adjusting for sex, age, smoking and diabetes mellitus; <sup>a</sup> Adjusted for age, smoking; <sup>b</sup> Adjusted for age, smoking and diabetes mellitus; <sup>c</sup> Adjusted for sex, age; <sup>d</sup> Adjusted for sex, age and diabetes mellitus.

**Figure S1.** Directed acyclic graphs for variable selection.

Directed acyclic graphs (DAGs) to show the hypothesized causal associations among rheumatoid arthritis (RA) (yellow-green circle), self-perceived oral health ("I" in a blue circle), and covariates. The proposed adjustment variable using the DAGitty is indicated by white circles. Ancestor variables of the outcome and not proposed adjustment variables are indicated by blue circles.
