

**A****B**

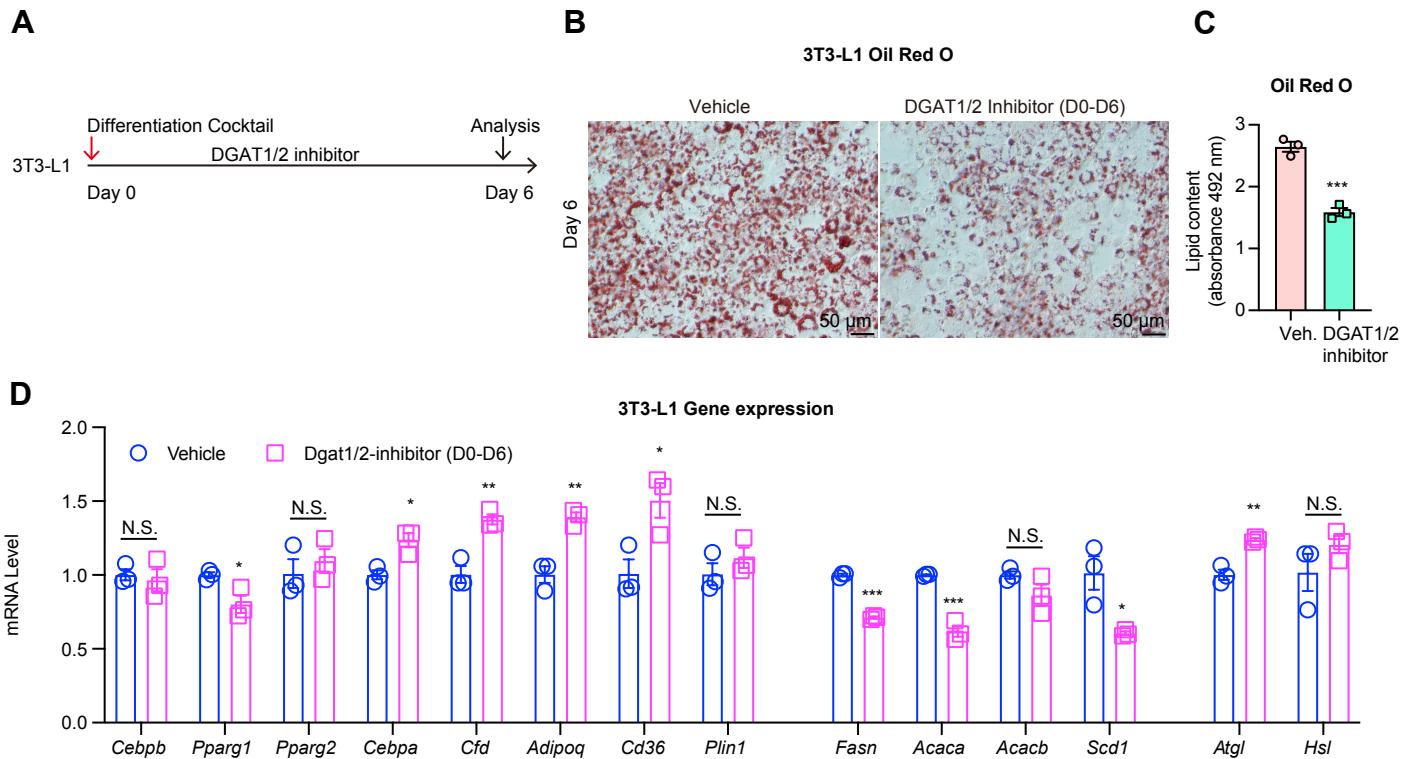

Supplementary Figure S1. Cell morphology of liver and Brown adipose tissue (BAT) did not change in response to prolonged fasting. A: H&E staining of BAT and liver from ad libitum fed, fasted mice or fast-ed-refed mice. B: qPCR analysis of gene expression of brown adipocyte markers in iWAT from ad libitum fed, fasted mice or fasted-refed mice. n=5/group. Data were represented as mean ± SEM. Statistical significance is calculated via a two-tailed Student's t-test (Fasted or refed group versus Ad libitum group). N.S.: not significant, \*p < 0.05, \*\* p < 0.01, \*\*\* p < 0.001.

**A****B****C****D**

Supplementary Figure S2. Biotin deprivation in 3T3-L1 preadipocyte differentiation. A: Experimental design. 3T3-L1 preadipocytes were differentiated in the presence of  $10^{-7}$  M Avidin from Day 0 to Day 7 of differentiation. B: Oil Red O staining of lipid droplets in 3T3-L1 cells on Day 7 of differentiation. C: Quantification of Oil Red O staining. D: qPCR analysis of gene expression of adipogenic markers and lipogenic genes on Day 7 of differentiation with or without Avidin treatment. (n=3, 3). N.S.: not significant, \* p < 0.05, \*\* p < 0.01, for control vs. Avidin treatment group by 2-tailed Student's t-test. Data were represented as mean  $\pm$  SEM.

Supplementary Figure S3. Inhibition of FASN shows stage-dependent effect on 3T3-L1 adipogenesis. A: Experimental design. 3T3-L1 preadipocytes were treated with FASN inhibitor, TVB-3664 (200 nM) through differentiation Day 0 to Day 6/7, or mature 3T3-L1 cells were treated with FASN inhibitor from differentiation Day 6 to Day 9. B,C: Oil Red O staining of lipid droplets in 3T3-L1 cells (fixed on Day 7) with or without TVB-3664 treatment. D: Gene expression of adipogenic and lipogenic marker genes in 3T3-L1 cells treated with TVB-3664 at Day 0 to Day 6 during differentiation. E,F: Oil Red O staining of lipid droplets in 3T3-L1 cells (fixed on Day 9) with or without TVB-3664 treatment. G: Gene expression of adipogenic and lipogenic marker genes in 3T3-L1 cells treated with TVB-3664 at Day 6 to Day 9 during differentiation. n=3, 3. N.S.: not significant, \* p < 0.05, \*\* p < 0.01, \*\*\* p < 0.001 for control vs. TVB-3664 treatment group by 2-tailed Student's t-test. Data were represented as mean ± SEM.

Supplementary Figure S4. Inhibiting TG synthesis does not block 3T3-L1 adipocyte differentiation despite preventing lipid droplet accumulation. A: Experimental design. 3T3-L1 preadipocytes were differentiated in the presence of DGAT1 inhibitor (PF-04620110, 3  $\mu$ M) and DGAT2 inhibitor (PF-06427878, 3  $\mu$ M) from Day 0 to Day 6. B,C: Oil Red O staining of lipid droplets in 3T3-L1 cells on Day 6 of differentiation. D: qPCR analysis of gene expression of adipogenic, lipogenic and lipolytic marker genes on Day 6 of differentiation. n=3, 3. N.S.: not significant, \* p < 0.05, \*\* p < 0.01, \*\*\* p < 0.001 for control vs. DGAT1/2 inhibitor treatment group by 2-tailed Student's t-test. Data were represented as mean  $\pm$  SEM.

**Supplementary Table S1. List of primers used in QPCR.**

Primer name	Primer sequence
Adipsin-F	CATGCTCGGCCCTACATGG
