

Figure S1. Vemurafenib-sensitivity of SK-MEL-28 parental and resistant cells. Cell proliferation at in increasing concentrations of vemurafenib were determined by sulphorhodamine B (SRB) assay (72 h). Resistant clones were cultured for one cell cycle in the absence of vemurafenib before each experiment. The dotted line indicates the half-maximal effect. Error bars represent the standard deviation.

Table S1

Phenotypic changes of dendritic cells (DC) cultured with conditioned medium of melanoma cells.

	Relative increase in surface expression*				
	CD80	CD86	CD83	CLASS I	CLASS II
LPS	5.35	5.75	3.12	1.63	1.72
SK-MEL-28	1.94	1.61	1.58	0.97	1.09
SK-MEL-28-VR2	2.59	3.46	2.56	0.98	1.57
SK-MEL-28-VR3	2.27	2.47	2.09	0.92	1.23

* The relative increase of indicated surface markers is expressed dividing the median fluorescence intensity (MFI) by the value of the corresponding markers for DC in medium alone (Control). The values of MFI for control DCs, in this representative assay, were 4.2, 12.4, 10.7, 10.9, and 31.5 for CD80, CB86, CD83, CLASS I, and CLASS II, respectively.
