Porcine decellularized diaphragm hydrogel: a new option for muscle malformations

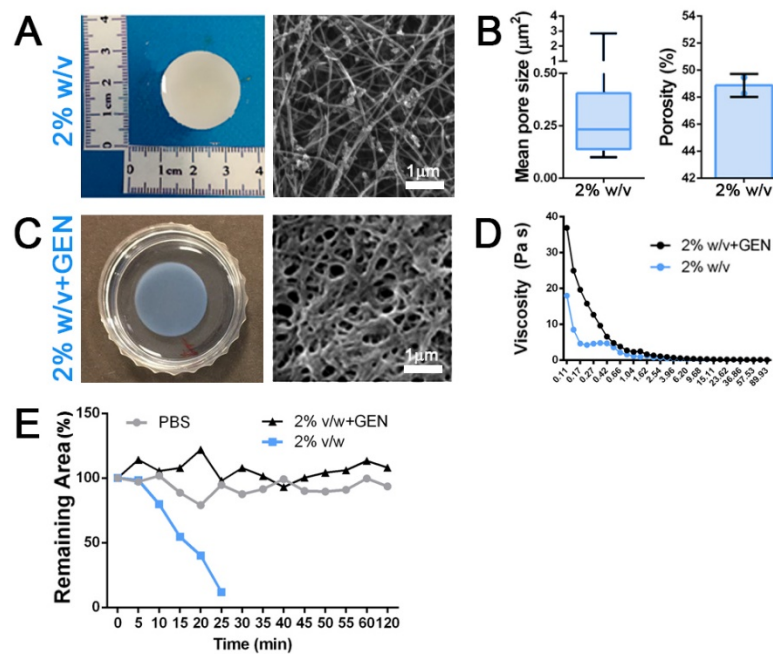

Daniele Boso, Eugenia Carraro, Edoardo Maghin, Silvia Todros, Arben Dedja, Monica Giomo, Nicola Elvassore, Paolo De Coppi, Piero Giovanni Pavan, Martina Piccoli*

Figure S1. Muscle-specific proteins in decellularized samples.

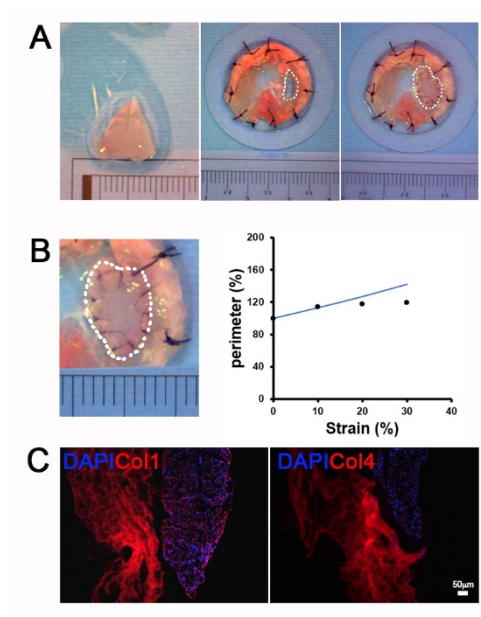

A. Percentage of coverage of specific muscle contraction proteins detected in decellularized samples. Highlighted with colors different isoforms of the same protein. **B.** Venn diagram showing the overlapping of detected proteins among triplicates of three different analyzed samples (EXP = experiment).

Figure S2. 2% w/v dECM-derived hydrogel characterization.

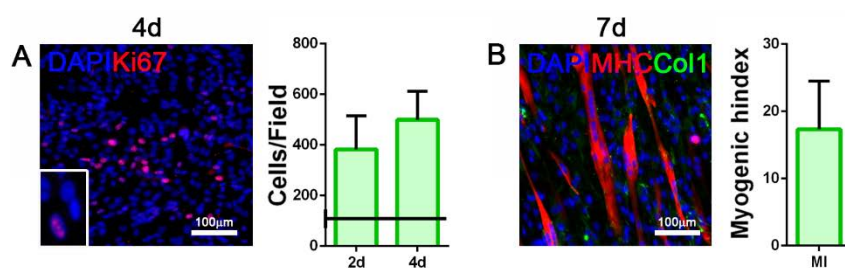

A. Gross appearance and ultrastructure of 2% w/v hydrogels. **B.** Mean pore size and porosity of 2% w/v hydrogels. **C.** Gross appearance and ultrastructure of 2% w/v hydrogels after crosslinking with genipin (+GEN). **D.** Viscoelastic properties under shear stress of 2% w/v hydrogels with and without genipin crosslinking. **E.** Degradation assay of 2% w/v hydrogels with and without genipin crosslinking using collagenase II. PBS: 2% w/v hydrogels without genipin and incubated with PBS (no collagenase II).

Figure S3. Preparation and analysis of crosslinked 3% w/v dECM-derived hydrogel application in ex vivo CDH model.

A. Gross appearance of crosslinked 3% w/v hydrogel patch (left panel), diaphragm defect (middle panel) and sutured patch on the defect (right panel). **B.** Calculated perimeter increasing during continuous stimulation up to 30% strain. Dots represent experimental results and solid curve is obtained from FE analysis. **C.** Immunofluorescence staining for the detection of Col1 and Col4 in crosslinked patches and damaged diaphragms after continuous mechanical stimulation.

Figure S4. In vitro hydrogel biocompatibility.

A. 2D culture of mixed hSKMC and hFb population after well coating with dECM-derived hydrogel. Quantification of cell growth (black line = number of seeded cells) after 2 and 4 days of culture. Proliferation marker (Ki67) in red. **B.** Differentiation of seeded cells and quantification of myogenic potential with calculation of myogenic index. Myosin heavy chain (MHC) in red; collagen 1 (Col1) in green. Nuclei are counterstained with DAPI (blue).
