

Supplementary Materials

Supplementary Figure 1. moDCs obtained from healthy donors were treated with indicated concentration of 6-BIO or β -catenin inhibitors (type and concentrations as shown) for 24 hours. DMSO (vehicle) served as mature moDCs control and cells were treated with LPS for the last 23 hours. A - G cell surface marker was measured with flow cytometry and shown as change of percentage of positive cells or median fluorescence intensity (MFI). Each symbol represents a different donor and lines represent the median.

Supplementary Figure 2. Antigen uptake assay. moDCs obtained from healthy donors were treated with indicated β -catenin inhibitors (ICG-001 4 μ M, axitinib 10 μ M, nitazoxanide (NTZ) 10 μ M) with/without 6-BIO 0.5 μ M or DMSO (vehicle) for 24 hours. mature-DCs, treated with 100 ng/ml LPS for the last 23 hours except iDCs. 50,000 cells were incubated with FITC-dextran at 37°C. After 1 hour of incubation, cells were washed and analyzed immediately by flow cytometry. Each symbol represents a different donor and lines represent the median.

A**B**

Supplementary Figure 3. Representative gating strategy for flow cytometry analysis. A) For moDCs surface markers, unstained samples were used to set the gates. B) For Mixed Leukocyte Reaction (MLR), negative controls were used to set the gates. 1% false-positive events were accepted throughout the analysis.
