**Table S1.** Antifungal susceptibility tests of Leg1, Leg2 and nisin against *A. niger* using a microdilution assay. Fungal growth was monitored at  $\Delta\text{OD}_{620\text{nm}}$  and compared to negative control ( $\text{OD}_{620\text{nm}} = 2.4$ ;  $n = 3$ ). For comparison, sodium benzoate was tested accordingly ( $n = 3$ ).

Concentration [ $\mu\text{M}$ ]	OD <sub>620nm</sub> values										
	1000	500	250	125	62.5	31.3	15.6	7.8	3.9	2.0	1.0

**Table S2.** Antifungal susceptibility tests of Leg1, Leg2 and nisin against *P. membranifaciens* using a microdilution assay. Fungal growth was monitored at  $\Delta\text{OD}_{620\text{nm}}$  and compared to negative control ( $\text{OD}_{620\text{nm}} = 2.1$ ;  $n = 3$ ). For comparison, sodium benzoate was tested accordingly ( $n = 3$ ).

**Figure S1.** Optical density (OD)<sub>620</sub> values of the blank controls consisting of water, yeast/molds (YM) agar and different concentrations of Leg1 or Leg2 (1–1 000  $\mu\text{M}$ ). The means  $\pm \text{SD}$  of triplicates are displayed. Water instead of the antimicrobial peptides was used as negative control (dashed line). The figure shows significant differences compared to the negative control.
