Number of pages: 17

Number of Tables: 9

Number of Figures: 7

## TABLE OF CONTENTS

### List of Tables:

Table S1: Average recoveries and their standard deviations determined from spiking experiments....	S2
Table S2: Input parameters used for the assessment of daily intakes from dust ingestion .....	S3

Table S3: Basic statistics of pesticide levels found in all dust samples.....	S4
Table S4: Basic statistics of pesticide levels found in all household dust samples collected at Hex River Valley.....	S5
Table S5: Basic statistics of pesticide levels found in all household dust samples collected at Grabouw.....	S6
Table S6: Daily intake (in $\text{pg kg}^{-1} \text{ day}^{-1}$ ) of individual pesticides via dust ingestion for a child .....	S7
Table S7: Daily intake (in $\text{pg kg}^{-1} \text{ day}^{-1}$ ) of individual pesticides via dust ingestion for an adult .....	S8
Table S8: Hazard quotients of children due to the exposure to individual pesticides via dust ingestion, inhalation, and soil ingestion found in this study .....	S9
Table S9: Hazard quotients of adults due to the exposure to individual pesticides via dust ingestion, inhalation, and soil ingestion found in this study.....	S10

### **List of Figures:**

Figure S1: Dust levels of individual pesticides in 12 households and one school measured at day 1 and day 7 .....	S11
Figure S2: Boxplots of concentrations of individual pesticides in dust samples .....	S12
Figure S3: Contribution of three exposure pathways on the daily uptake of pesticides of a children living at farm and village locations at Hex River Valley and Grabouw using the maximum concentrations.....	S13
Figure S4: Contribution of three exposure pathways on the daily uptake of pesticides of a children living at farm and village locations at Hex River Valley and Grabouw using the median concentrations and high ingestion rate .....	S14
Figure S5: Contribution of three exposure pathways on the daily uptake of pesticides of an adult living at farm and village locations at Hex River Valley and Grabouw using the median concentrations ...	S15
Figure S6: Contribution of three exposure pathways on the daily uptake of pesticides of an adult living at farm and village locations at Hex River Valley and Grabouw using the maximum concentrations	S16
Figure S7: Contribution of three exposure pathways on the daily uptake of pesticides of an adult living at farm and village locations at Hex River Valley and Grabouw using the median concentrations and the high ingestion rate of dust .....	S17

Table S1: Average recoveries and their standard deviations determined from spiking experiments. (n3)

Dust	
Acetochlor	42.5 (2.9)
Alachlor	96.1 (13.6)
Atrazine	60.9 (10.7)
Azinphos methyl	113.8 (27.5)
Carbaryl	69.9 (3.0)
Carbendazim	109.8 (10.3)

Chlorotoluron	80.6 (4.1)
Chlorpyrifos	55.3 (14.8)
Chlorsulfuron	120.1 (1.9)
Diazinon	49.6 (7.2)
Dimethachlor	95.8 (6.4)
Dimethoate	90.2 (4.2)
Diuron	85.9 (3.5)
Fenitrothion	96.8 (10.8)
Fluroxypyr	110.7 (17.5)
Isoproturon	75.2 (3.7)
Malathion	109.7 (20.3)
Metamitron	95.6 (5.2)
Metazachlor	96.5 (4.0)
Metribuzin	89.4 (4.7)
Parathion methyl	100.4 (3.7)
Pendimethalin	87.7 (9.4)
Pirimicarb	48.0 (10.3)
Prochloraz	95.4 (1.3)
Propiconazole	110.6 (3.2)
Pyrazon	89.8 (2.0)
Simazine	85.8 (5.2)
S-metolachlor	84.7 (4.2)
Tebuconazole	106.7 (6.5)
Terbutylazine	94.6 (2.9)

Table S2: Input parameters used for the assessment of daily intakes from dust ingestion.

		Children	Adult	Reference
IngR <sub>dust</sub>	Median	0.04	0.02	[75]
	High	0.1	0.06	[75]
AF		0.14	0.14	[76]
BW		31.8	80	[75]

Table S3: Basic statistics of pesticide levels found in all dust samples. QF indicates quantification frequency in percentage; IQR indicates interquartile range. For propiconazole, S-metolachlor, diuron, and malathion, only the concentrations above the quantification limits were considered, while for the remaining pesticides, imputed data were considered for statistics.

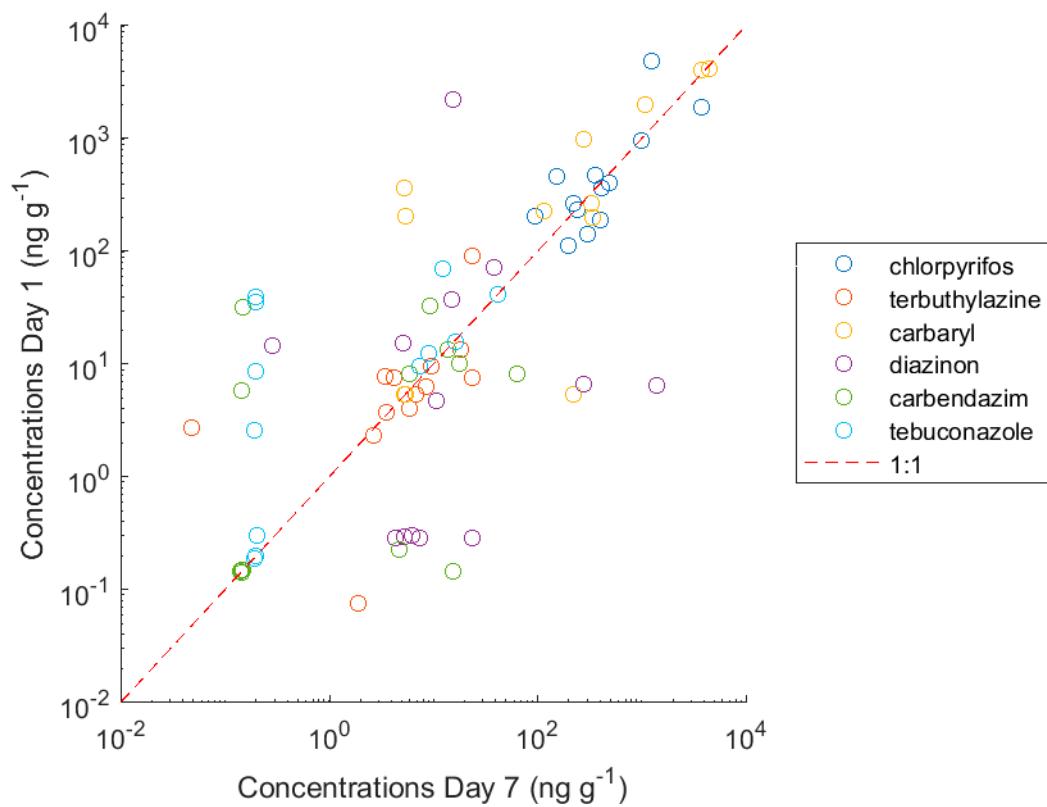

Figure S1: Dust levels of individual pesticides (in ng g<sup>-1</sup>) in 12 households and one school measured at day 1 and day 7.

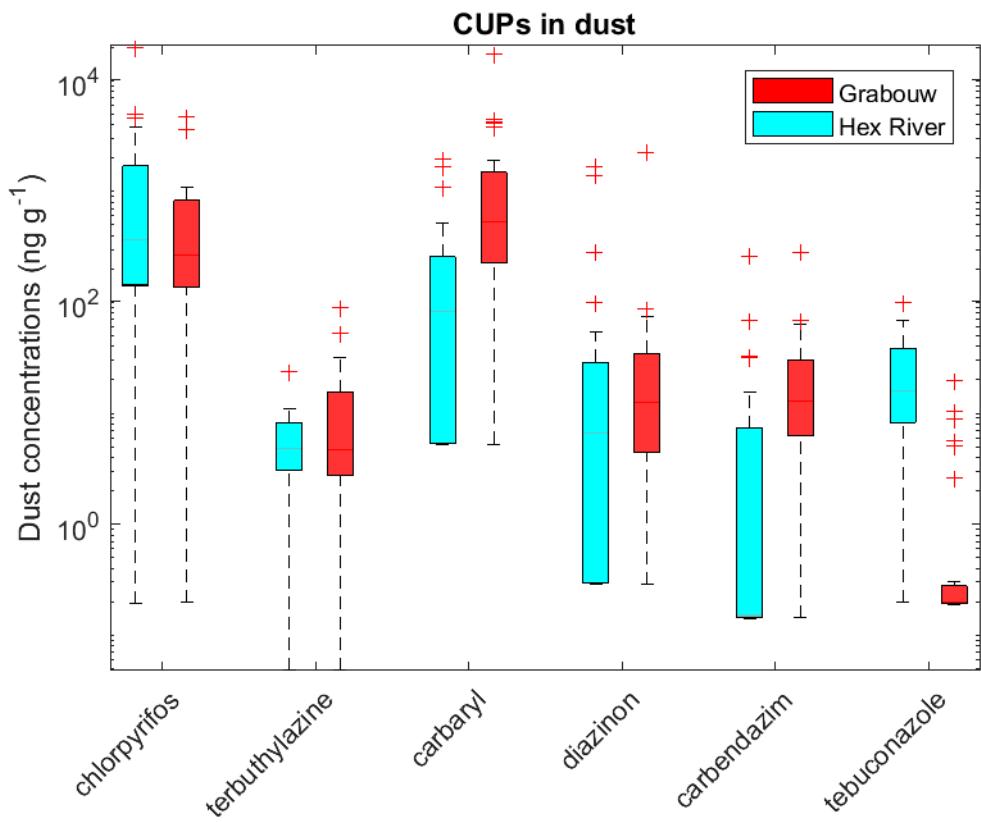

Figure S2: Boxplots of concentrations of individual pesticides in dust samples ( $\text{in ng g}^{-1}$ ). All samples (i.e., day 1, day 7, village, farm, and schools,  $n=54$ ) were considered. Boxplots represent the 25-75<sup>th</sup> percentile, whiskers represent the minimum and maximum values (excluding outliers which are shown as the red crosses) and the line within the box represents the median value.

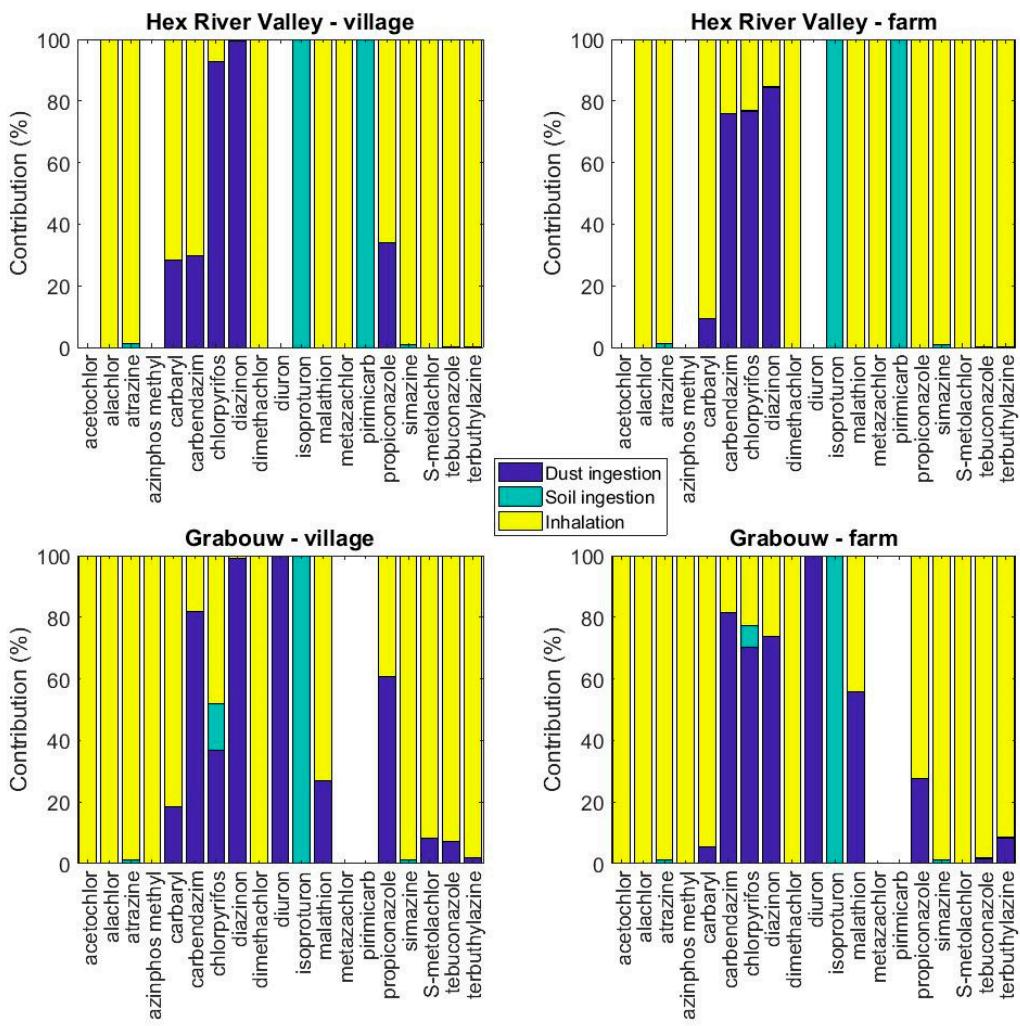

Figure S3: Contribution (in %) of three exposure pathways (dust ingestion, soil ingestion, and inhalation) on the daily uptake of pesticides of a children living at farm and village locations at Hex River Valley and Grabouw using the maximum concentrations. Data on the daily intakes from inhalation and soil ingestion of individual pesticides were obtained from [68].

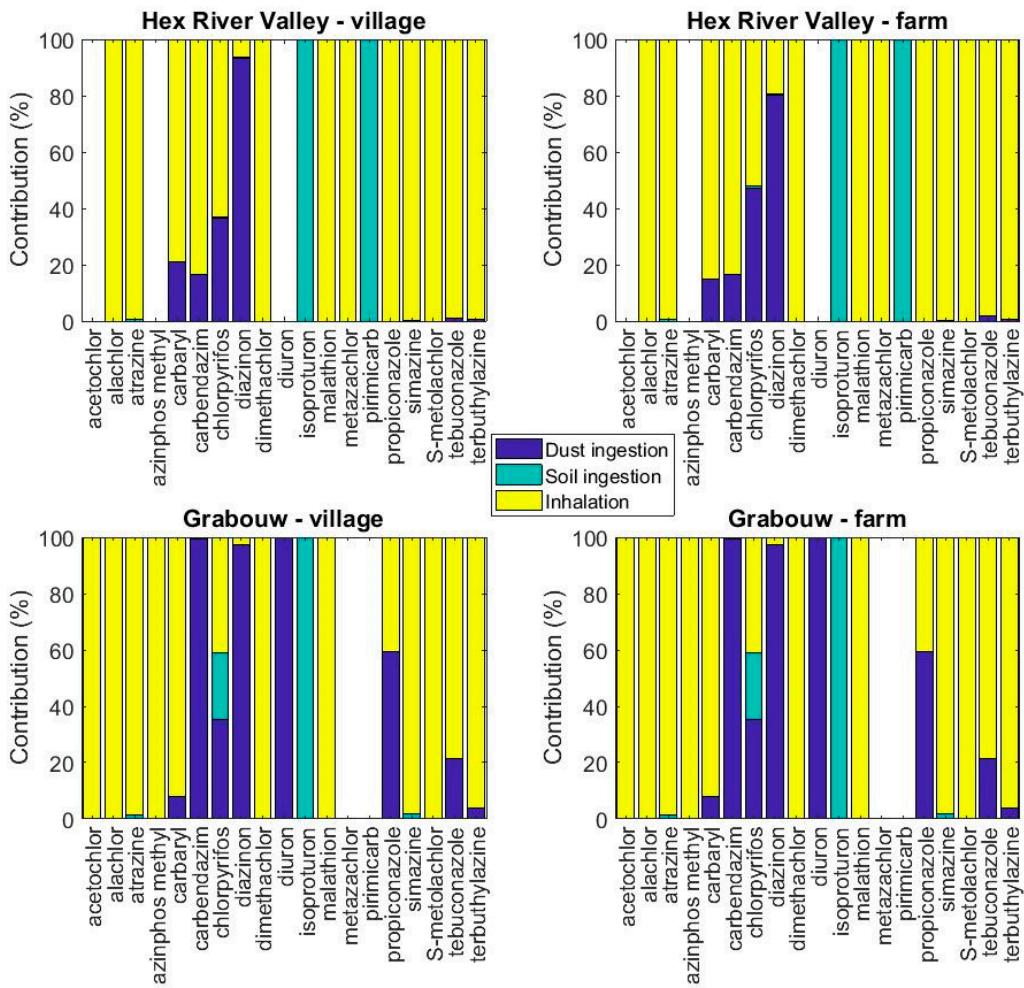

Figure S4: Contribution (in %) of three exposure pathways (dust ingestion, soil ingestion, and inhalation) on the daily uptake of pesticides of a children living at farm and village locations at Hex River Valley and Grabouw using the median concentrations and high ingestion rate. Data on the daily intakes from inhalation and soil ingestion of individual pesticides were obtained from [68].

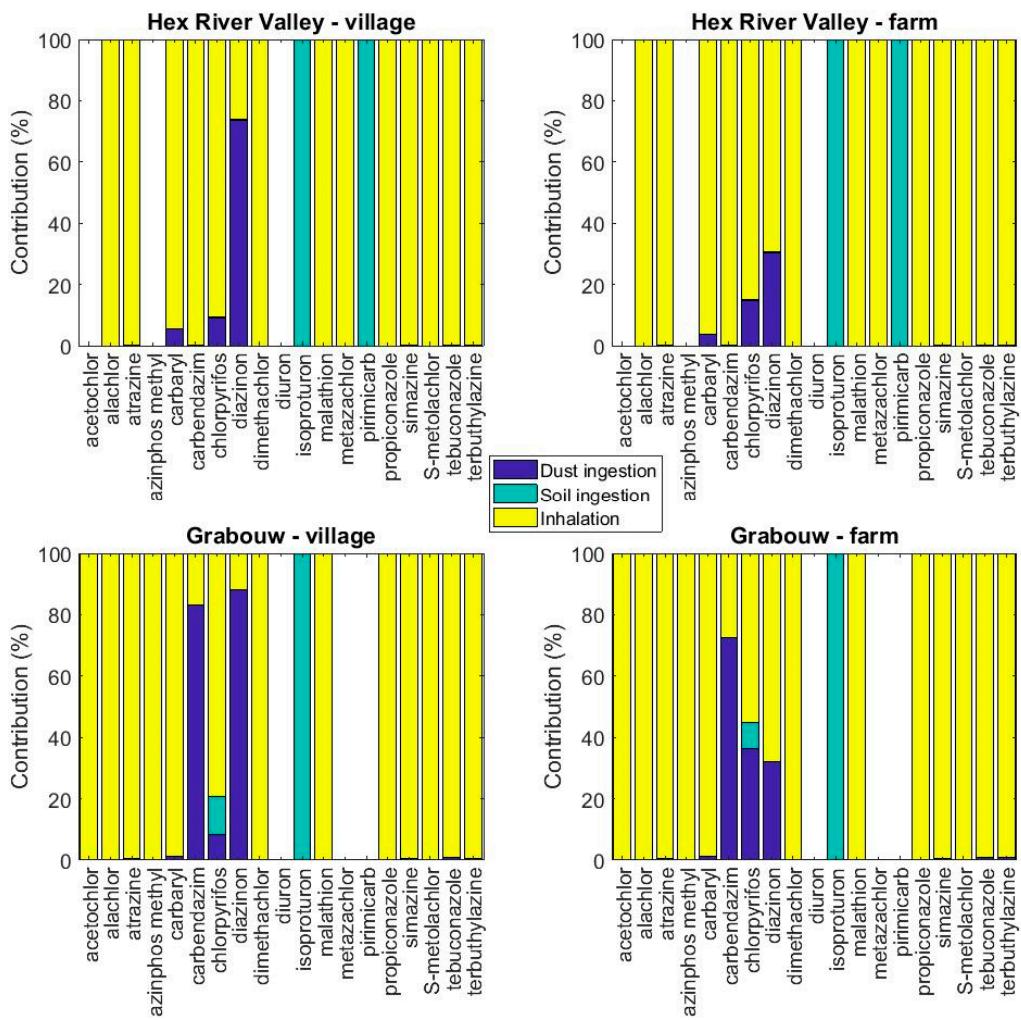

Figure S5: Contribution (in %) of three exposure pathways (dust ingestion, soil ingestion, and inhalation) on the daily uptake of pesticides of an adult living at farm and village locations at Hex River Valley and Grabouw using the median concentrations. Data on the daily intakes from inhalation and soil ingestion of individual pesticides were obtained from [68].

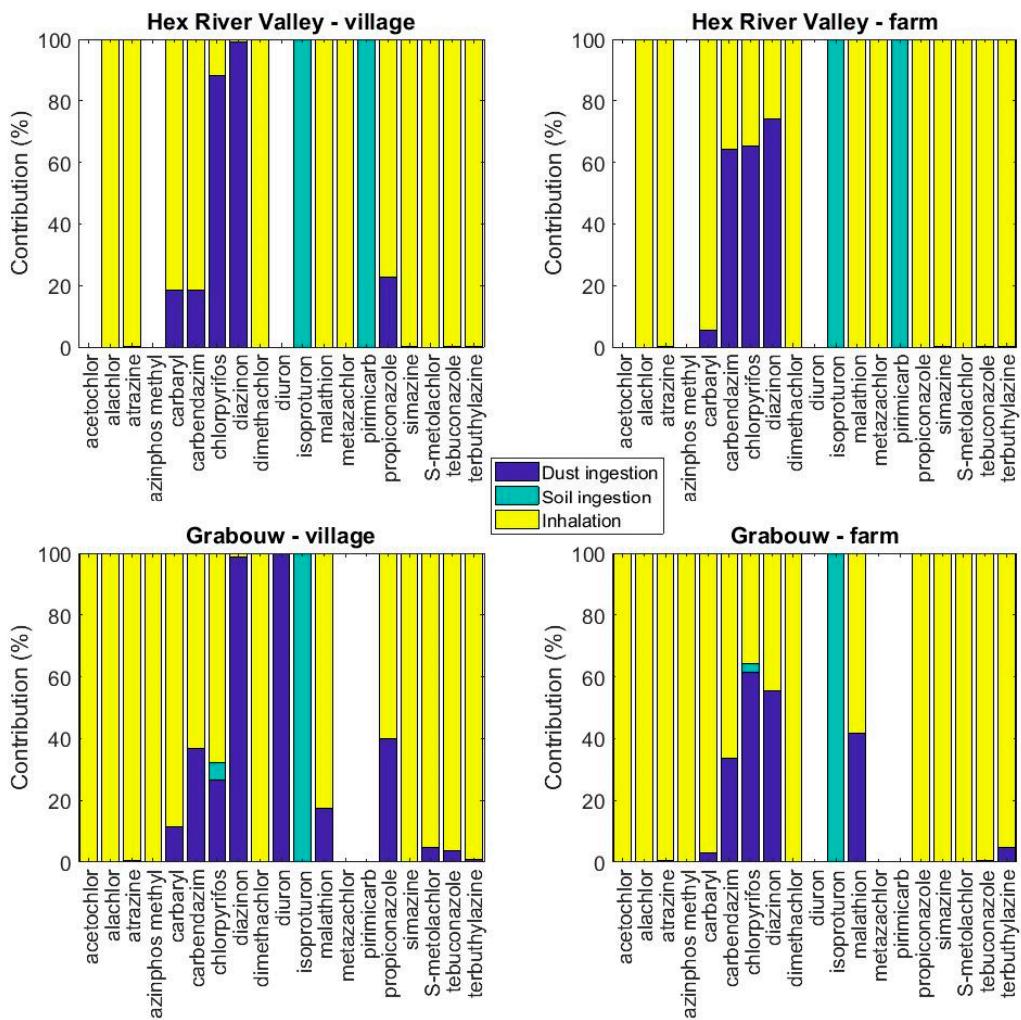

Figure S6: Contribution (in %) of three exposure pathways (dust ingestion, soil ingestion, and inhalation) on the daily uptake of pesticides of an adult living at farm and village locations at Hex River Valley and Grabouw using the maximum concentrations. Data on the daily intakes from inhalation and soil ingestion of individual pesticides were obtained from [68].

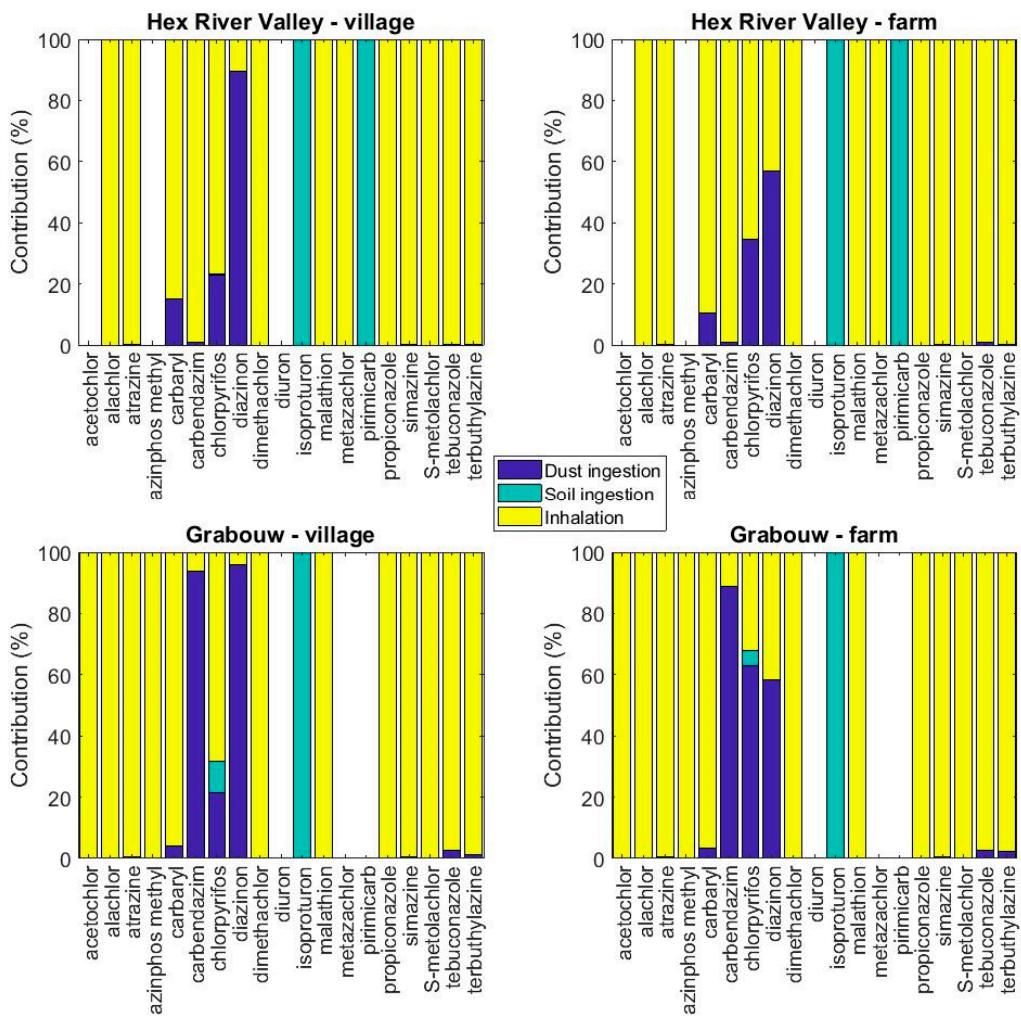

Figure S7: Contribution (in %) of three exposure pathways (dust ingestion, soil ingestion, and inhalation) on the daily uptake of pesticides of an adult living at farm and village locations at Hex River Valley and Grabouw using the median concentrations and the high ingestion rate of dust. Data on the daily intakes from inhalation and soil ingestion of individual pesticides were obtained from [68].
