### **Biofilm and rivers: the natural association to reduce metals in waters.**

#### **Method M1.** Quantification of carotenoids and chlorophylls in biofilm

Algal and bacterial pigments are extracted (overnight, at 4 °C, in the dark and under nitrogen) from ca. 1-2 g wet biofilm using 90% acetone and then centrifuged at 4000 rpm for 10 min in 15 ml glass centrifuge tubes. The supernatant is used to measure total pigment concentration (UV-VIS spectrophotometer, SAFAS UVmc2) and specific carotenoids (HPLC Ultimate 3000, Thermo Fisher Scientific).

SAFS UV-Vis mc2 is a dual-band spectrophotometer, the spectra are recorded in the range 350-800nm and the Chlorophyll Derivatives (CD) and Total Carotenoids (TC) are calculated as reported in Lami et.al [32]. Specific carotenoids and chlorophylls are determined by ion pairing and reverse-phase HPLC. Pigment concentrations are expressed as nanomoles per gram of organic matter. The ion pairing (PIC A) allows for greater resolution of the dephytolated acidic chloropigments (Chl c, chlorophyllide a, and pheophorbide a).

The HPLC system consists of an autosampler (Ultimate 3000), a quaternary pump (P680), a thermostated column oven (TCC100), and a DAD detector (Ultimate 3000). The chromatogram is acquired at 460 nm and 656 nm for carotenoids and chloropigments, respectively. The whole spectra, for peak identification, are also recorded. The column is a C18 ODS column (5 µm particle size; 250 mm x 4.6 mm i.d.). After sample injection (100 µl of acetone extract, a gradient program that ramped from 85% mobile-phase A (80:20, by vol. methanol: aqueous solution of 0.001 M PIC A ion-pairing and 0.001 M propionic acid) to 100% mobile-phase B (60:40, acetone: methanol) in 30 min with a hold for 20 min provided sufficient resolution of all pigments of interest. Flow rates from 1 ml min<sup>-1</sup> to 2 ml min<sup>-1</sup>. The column is re-equilibrated between samples by linear ramping to 85% mobile-phase A for 5 min and maintenance for 10 min before sample injection. With this procedure, we are able to separate zeaxanthin from lutein and β-carotene from pheophytin a. Analysis of replicates samples yielded a C.V. of 4.5%- 11.5%, depending on pigments.

**Table S1.** List of diatomic species. Species expressed as presence/absence identified in the 6 samples analyzed and risk status according to the Red List (Hofmann et al., 2018). 0-not classified, 3-Highly endangered, 4-Threatened of extinction, 5-Risk not estimated, 7-Early alert, 8-Not endangered, 9-Not enough data.

Species	Red List	March			October		
		Site 1	Site 2	Site 3	Site 1	Site 2	Site 3
<i>Achnanthidium eutrophilum</i> (Lange-Bertalot) Lange-Bertalot	8	x	x
