

## Supplemental Information

### Toxicity of Aqueous L-Selenomethionine and Tert-Butyl Hydroperoxide Exposure to Zebrafish (*Danio rerio*) Embryos Following Tert-Butyl Hydroquinone Treatment

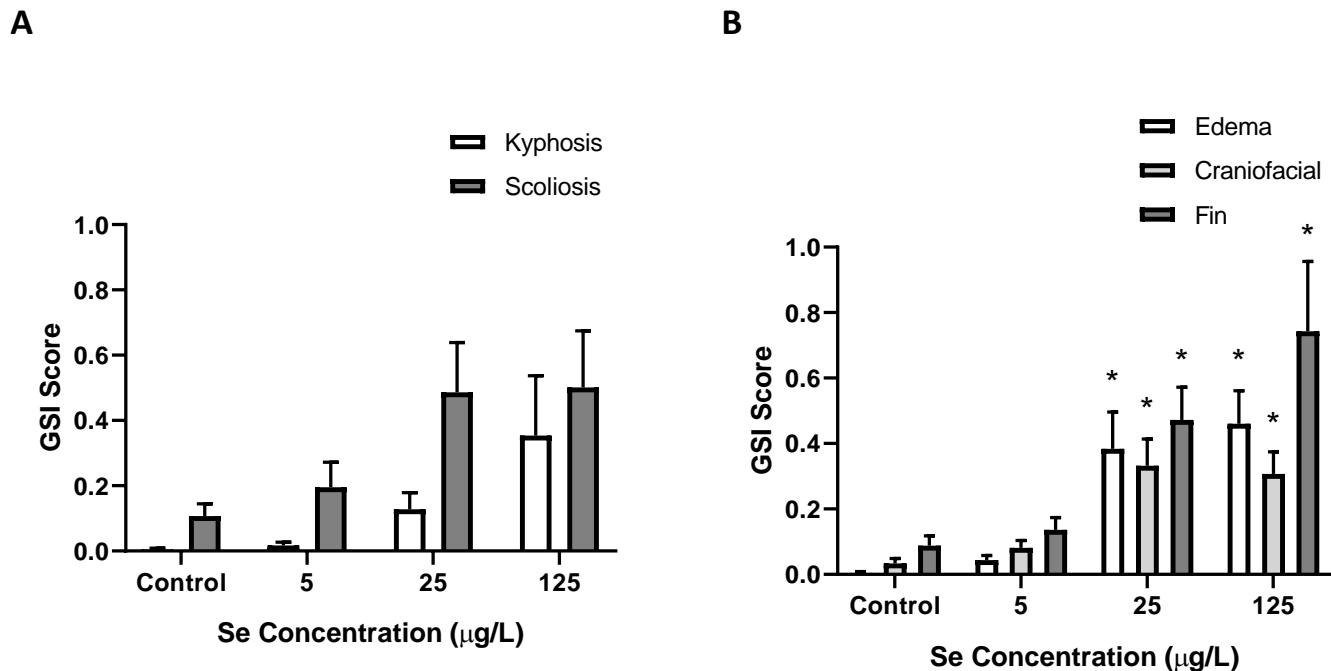

Allyson K. Gerhart and David M. Janz

**Table S1** Target genes and their primer sequences, accession numbers, and efficiencies used for real time qRT-PCR [10,12,20-21].

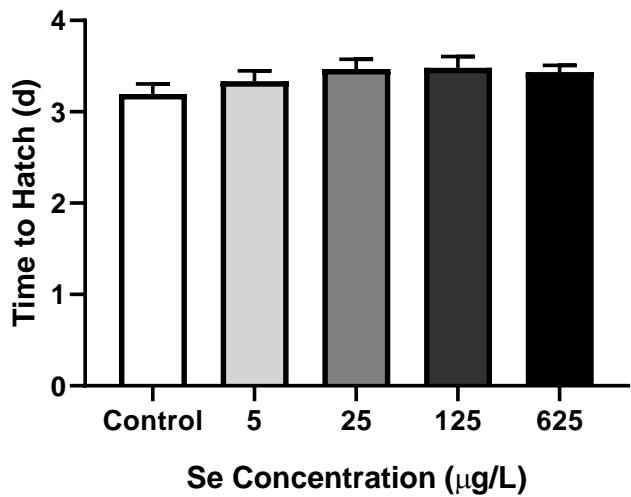

Target Gene	Accession #	Primer sequences (5'-3')	Efficiency (%)
nrf2a	NM_182889.1	F: ACACACACCTGAAGCAGACG R: GGCATCATGAGATCAGTGGA	135.054

**A****B**

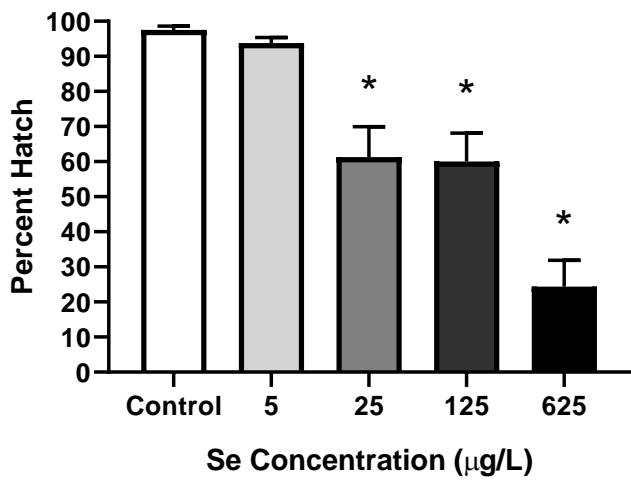

**Figure S1.** Mean ( $\pm$ SE) percentage of (A) skeletal deformities (kyphosis and scoliosis) and (B) other deformities (craniofacial, finfold, and edema) in larval zebrafish exposed to increasing concentrations of L-selenomethionine (SeMet) via embryo aqueous exposure. Asterisks represent significant differences compared to the control using a Kruskal–Wallis one-way analysis of variance (ANOVA) by ranks followed by Dunn's multiple comparisons test ( $p < 0.05$ );  $n = 9\text{--}12$  replicates of 20 embryos.

**Figure S2.** Mean ( $\pm\text{SE}$ ) graduated severity index (GSI) scores of (A) skeletal deformities (kyphosis and scoliosis) and (B) other deformities (craniofacial, finfold, and edema) in larval zebrafish exposed to increasing concentrations of L-selenomethionine (SeMet) via embryo aqueous exposure. Asterisks represent significant differences compared to the control using a Kruskal–Wallis one-way analysis of variance (ANOVA) by ranks followed by a Dunn's multiple comparisons ( $p < 0.05$ );  $n = 9\text{--}12$  replicates of 20 embryos.

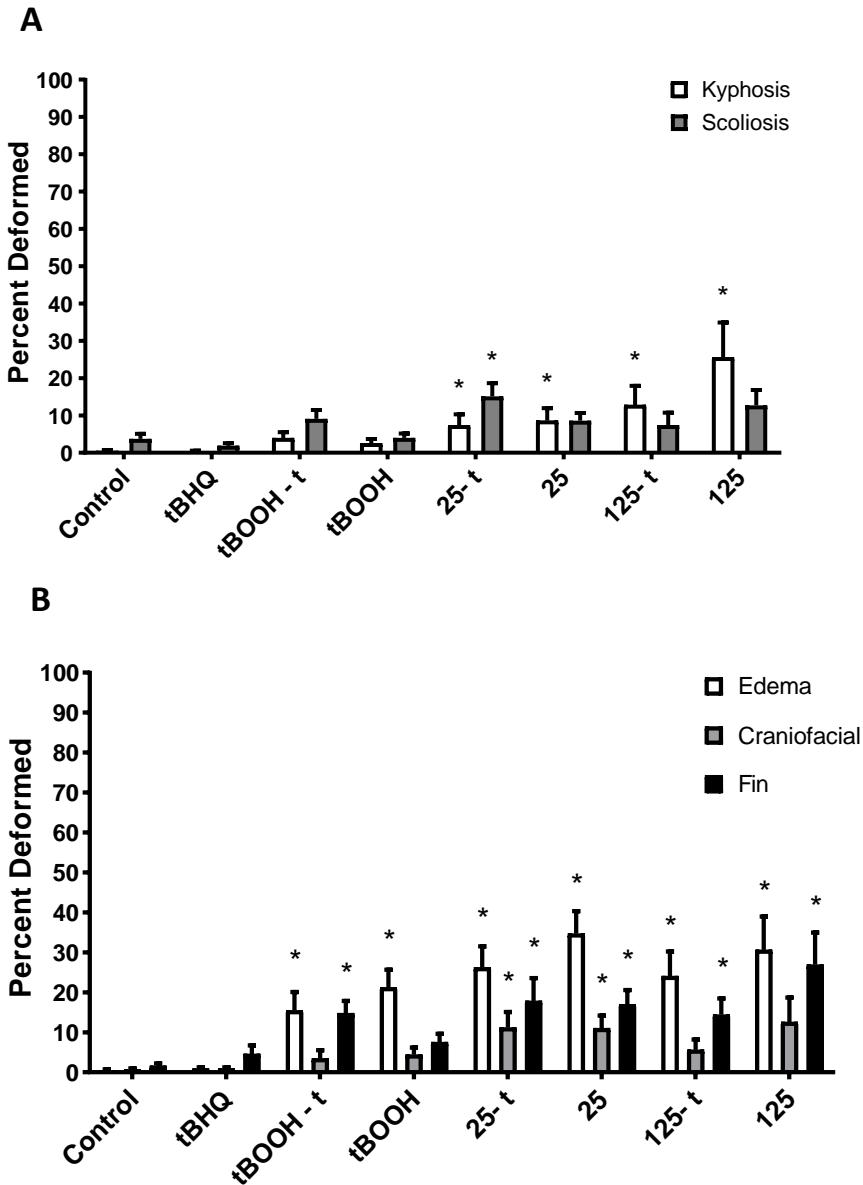

**Figure S3.** Mean ( $\pm$  SE) time to hatch in zebrafish exposed to increasing concentrations of L-selenomethionine (SeMet) via embryo aqueous exposure. Asterisks represent significant differences from control using a Kruskal–Wallis one-way analysis of variance (ANOVA) by ranks followed by a Dunn's multiple comparisons test ( $p < 0.05$ );  $n = 8\text{--}12$  replicates of 20 embryos.

**Figure S4.** Mean ( $\pm$  SE) percent hatch of zebrafish exposed to increasing concentrations of L-selenomethionine (SeMet) via embryo aqueous exposure. Asterisks represent significant

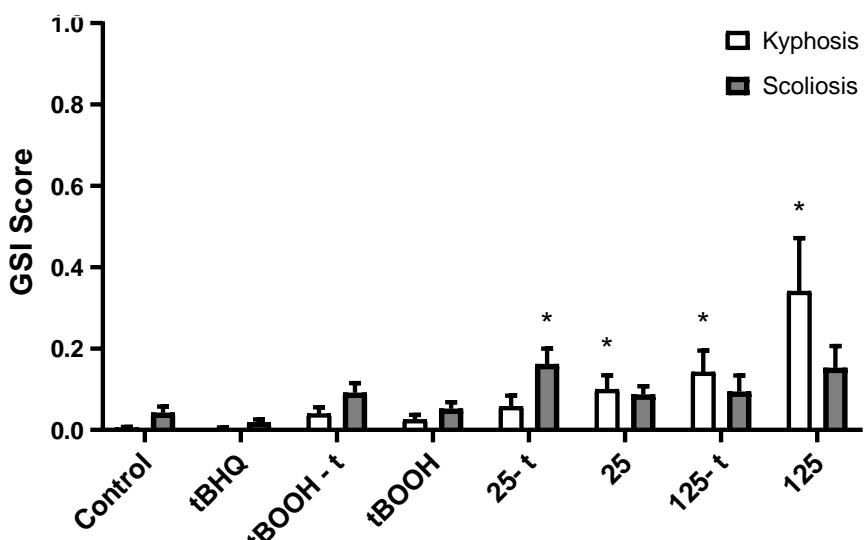

differences from control using a Kruskal–Wallis one-way analysis of variance (ANOVA) by ranks followed by a Dunn's multiple comparisons test ( $p < 0.05$ );  $n = 8\text{--}12$  replicates of 20 embryos.

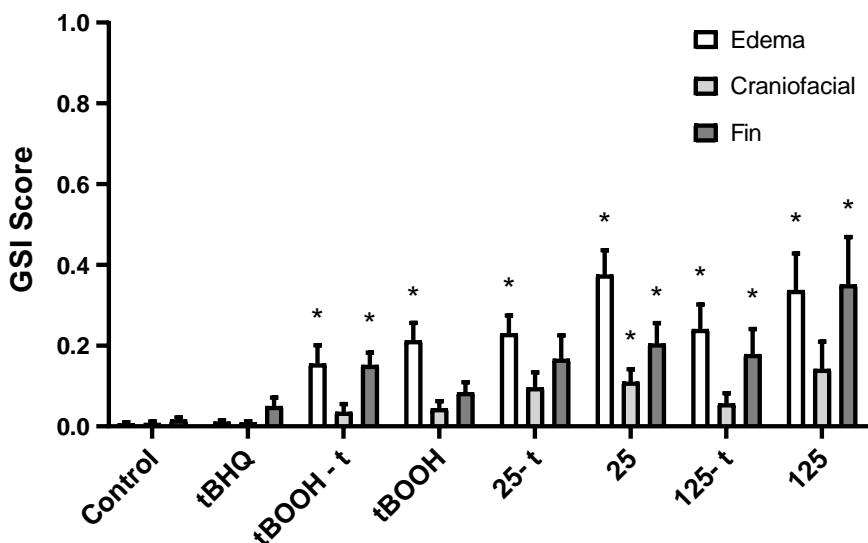

**Figure S5.** Mean ( $\pm$ SE) percentage of (A) skeletal deformities (kyphosis and scoliosis) and (B) other deformities (craniofacial, finfold, and edema) in larval zebrafish exposed via embryo

aqueous exposure to facility water (control), tBHQ, tBOOH, and two concentrations of SeMet (25 and 125 µg Se/L) either with (tBOOH-t, 25-t, 125-t) or without (tBOOH, 25, 125) a tBHQ pre-treatment. Asterisks represent significant differences from control using a Kruskal–Wallis one-way analysis of variance (ANOVA) by ranks followed by a Dunn's multiple comparisons test ( $p < 0.05$ );  $n = 13\text{--}33$  replicates of 20 embryos.

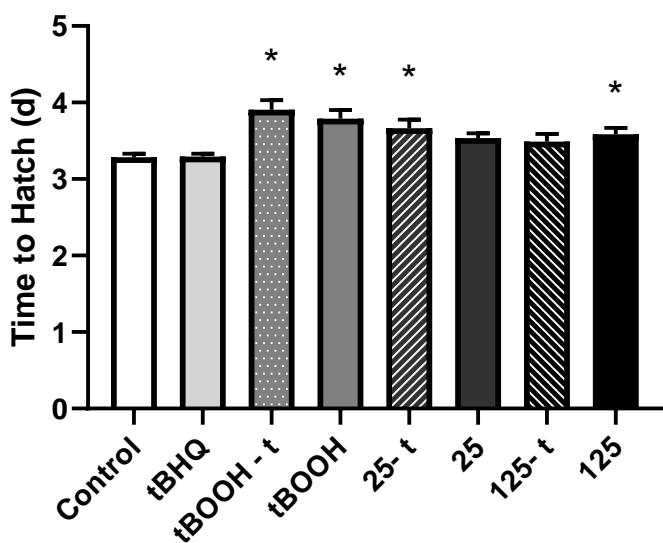

**A**

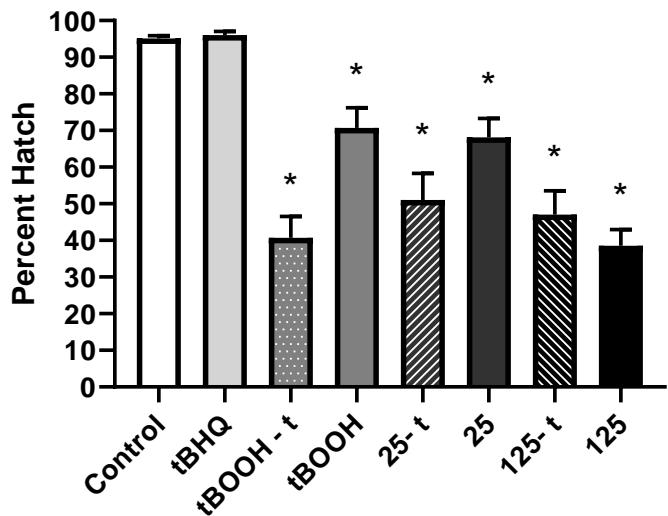

**B**

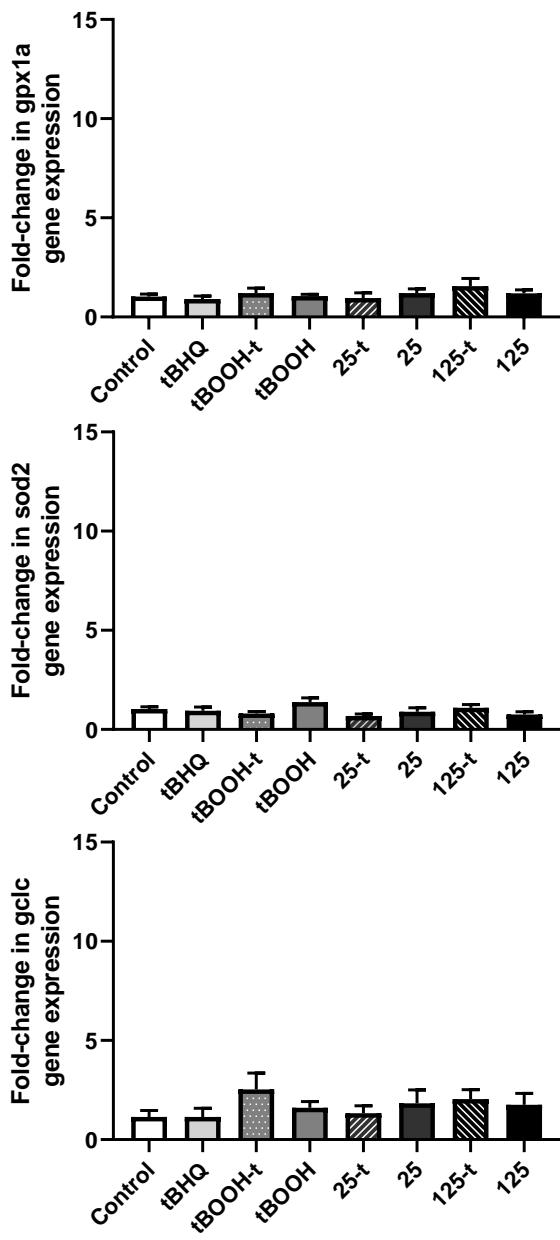

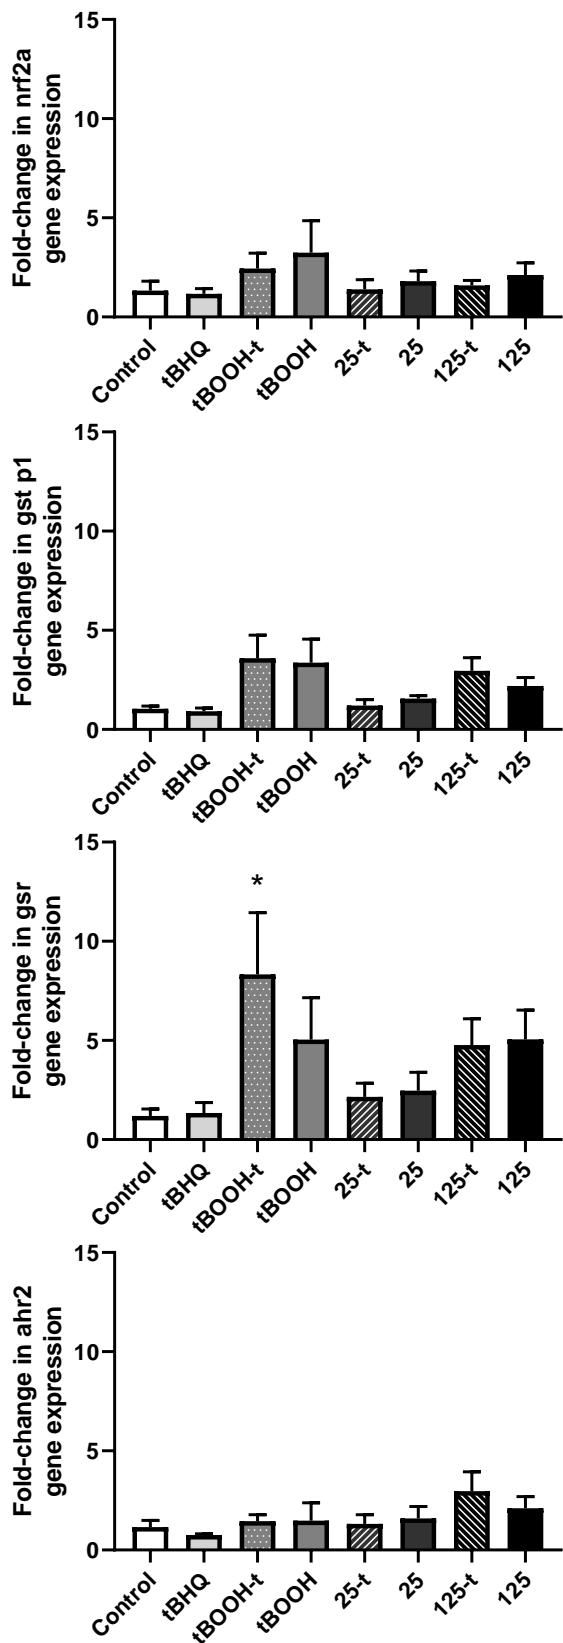

**Figure S6.** Mean ( $\pm$ SE) graduated severity index (GSI) scores of (A) skeletal deformities (kyphosis and scoliosis) and (B) other deformities (craniofacial, finfold, and edema) in larval zebrafish exposed via embryo aqueous exposure to facility water (control), tBHQ, tBOOH, and two concentrations of SeMet (25 and 125  $\mu$ g Se/L) either with (tBOOH-t, 25-t, 125-t) or without (tBOOH, 25, 125) a tBHQ pre-treatment. Asterisks represent significant differences from control using a Kruskal–Wallis one-way analysis of variance (ANOVA) by ranks followed by a Dunn's multiple comparisons test ( $p < 0.05$ );  $n = 13\text{--}33$  replicates of 20 embryos.

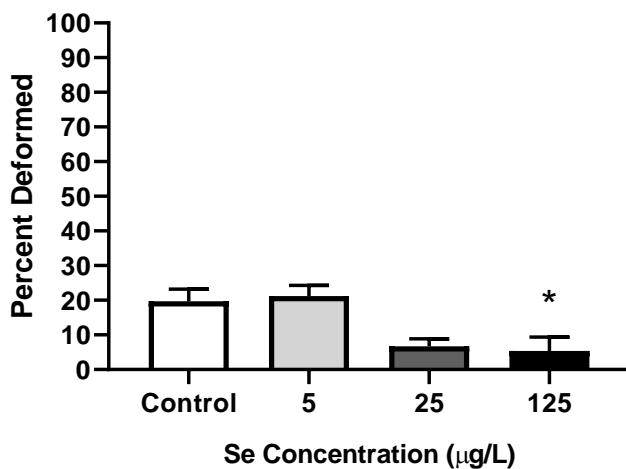

**Figure S7.** Mean ( $\pm$  SE) time to hatch in zebrafish exposed via embryo aqueous exposure to facility water (control), tBHQ, tBOOH, and two concentrations of SeMet (25 and 125  $\mu$ g Se/L) either with (tBOOH-t, 25-t, 125-t) or without (tBOOH, 25, 125) a tBHQ pre-treatment. Asterisks represent significant differences compared to the control using a Kruskal–Wallis one-way analysis of variance (ANOVA) by ranks followed by a Dunn's multiple comparisons test ( $p < 0.05$ );  $n = 20\text{--}33$  replicates of 20 embryos.

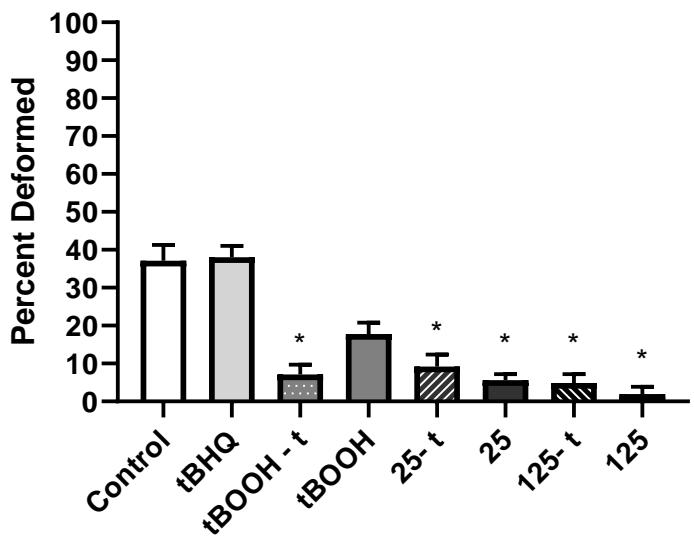

**Figure S8.** Mean ( $\pm$  SE) percent hatch of zebrafish exposed via embryo aqueous exposure to facility water (control), tBHQ, tBOOH, and two concentrations of SeMet (25 and 125  $\mu$ g Se/L) either with (tBOOH-t, 25-t, 125-t) or without (tBOOH, 25, 125) a tBHQ pre-treatment. Asterisks represent significant differences compared to the control using a Kruskal–Wallis one-way analysis of variance (ANOVA) by ranks followed by a Dunn's multiple comparisons test ( $p < 0.05$ );  $n = 20\text{--}33$  replicates of 20 embryos.

**Figure S9.** Mean ( $\pm$  SE) fold change in gene expression in zebrafish exposed via embryo aqueous exposure to facility water (control), tBHQ, tBOOH, and two concentrations of SeMet (25 and 125  $\mu$ g Se/L) either with (tBOOH-t, 25-t, 125-t) or without (tBOOH, 25, 125) a tBHQ pre-treatment. Asterisks represent significant differences compared to the control using either a one-way analysis of variance (ANOVA) followed by Holm-Sidak's multiple comparisons test or a Kruskal-Wallis one-way ANOVA followed by a Dunn's multiple comparisons test ( $p < 0.05$ );  $n = 4\text{--}5$  replicates of 11-20 zebrafish larvae.

**Figure S10.** Mean ( $\pm$ SE) percentage of lordosis in larval zebrafish exposed to increasing concentrations of L-selenomethionine (SeMet) via embryo aqueous exposure. Asterisks represent significant differences compared to the control using a Kruskal-Wallis one-way analysis of variance (ANOVA) by ranks followed by Dunn's multiple comparisons test ( $p < 0.05$ );  $n = 9\text{--}12$  replicates of 20 embryos.

**Figure S11.** Mean ( $\pm$ SE) percentage of lordosis in larval zebrafish exposed via embryo aqueous exposure to facility water (control), tBHQ, tBOOH, and two concentrations of SeMet (25 and 125  $\mu$ g Se/L) either with (tBOOH-t, 25-t, 125-t) or without (tBOOH, 25, 125) a tBHQ pre-treatment. Asterisks represent significant differences from control using a Kruskal–Wallis one-way analysis of variance (ANOVA) by ranks followed by a Dunn's multiple comparisons test ( $p < 0.05$ );  $n = 13\text{--}33$  replicates of 20 embryos.
