1. Freundlich Isotherms

(a)

(b)

(c)

Figure S1. (a) Freundlich plot for PU 1; (b) Freundlich plot for PU-Si 2; (c) Freundlich plot for PU-ac 3.

Freundlich isotherm:

$$\ln q_e = \ln k_F + \frac{1}{n} \ln C_e \quad (1)$$

where C_e (mg/L) is the concentration of adsorbate in the liquid phase at equilibrium and q_e (mg/g) is the amount of adsorbate adsorbed on the solid phase at equilibrium. k_F (mg/g) $(\text{L/mg})^{1/n}$ indicates the adsorption capacity, and n reflects the intensity of adsorption according to the Freundlich theory.

2. Langmuir Dimensionless Constant

One of the essential characteristics of the Langmuir isotherm can be expressed by a dimensionless constant, separation factor, R_L , defined as follows:

$$R_L = \frac{1}{1 + k_L C_0} \quad (2)$$

The value of R_L indicates the type of the isotherm, which is unfavorable ($R_L > 1$), linear ($R_L = 1$), favorable ($0 < R_L < 1$) or irreversible ($R_L = 0$).

In the following Table we report the R_L values for each starting concentration of oil used:

Table S1. R_L values at several initial concentrations.

C_0	R_L PU	R_L PU-Si	R_L PU-ac
10	0.06	0.12	0.08
20	0.03	0.06	0.04
30	0.02	0.04	0.03
40	0.02	0.03	0.02
50	0.01	0.03	0.02

3. FT-IR Spectra

Figure S2. FT-IR spectra of 1–3.
