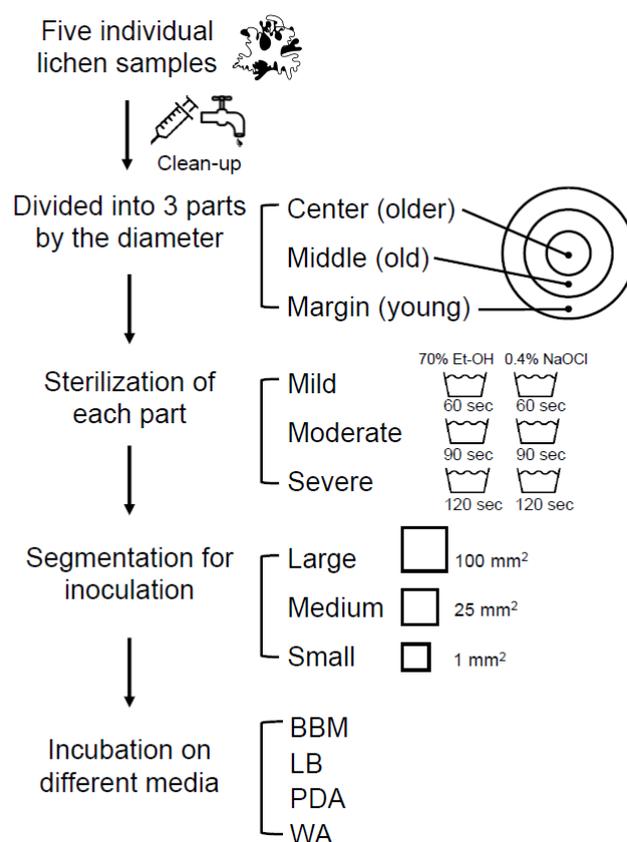

Figure S1. Schematic diagram of experimental design adopted for ELFI isolation.

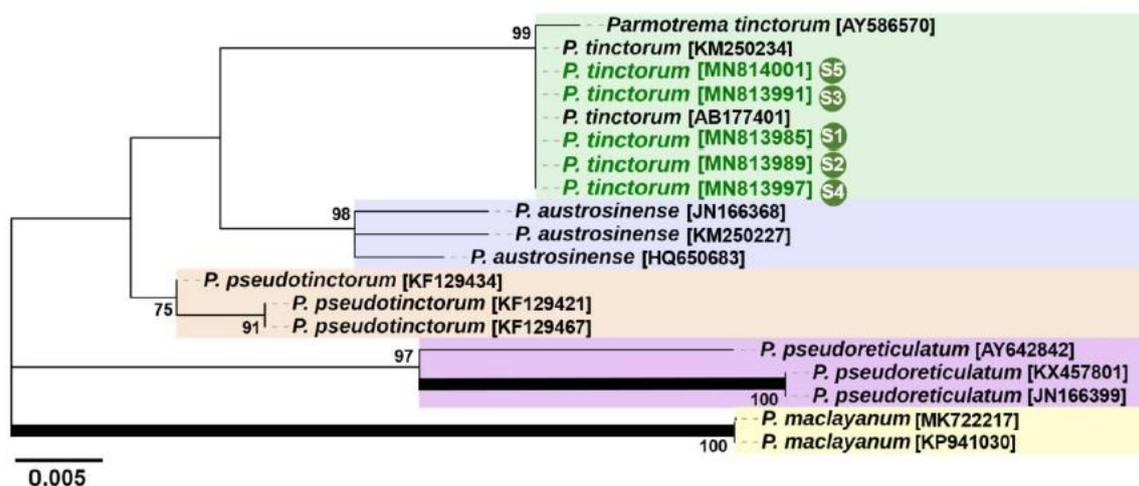

Figure S2. Phylogenetic identification of host lichen *Parmotrema tinctorum*. Maximum likelihood (ML) phylogenetic tree of the ITS nrDNA gene showed phylogenetic relationships of five species (Each species is marked with a different color range.) of *Parmotrema*. The samples used in this study are marked with green color. The site numbers are written next to the names of samples (S1,S2,S3,S4,S5). Bootstrap (BS) values (1000 replicates) > 70% of ML are shown near the nodes. Branches supported by BS = 100% are highlighted with thick lines.

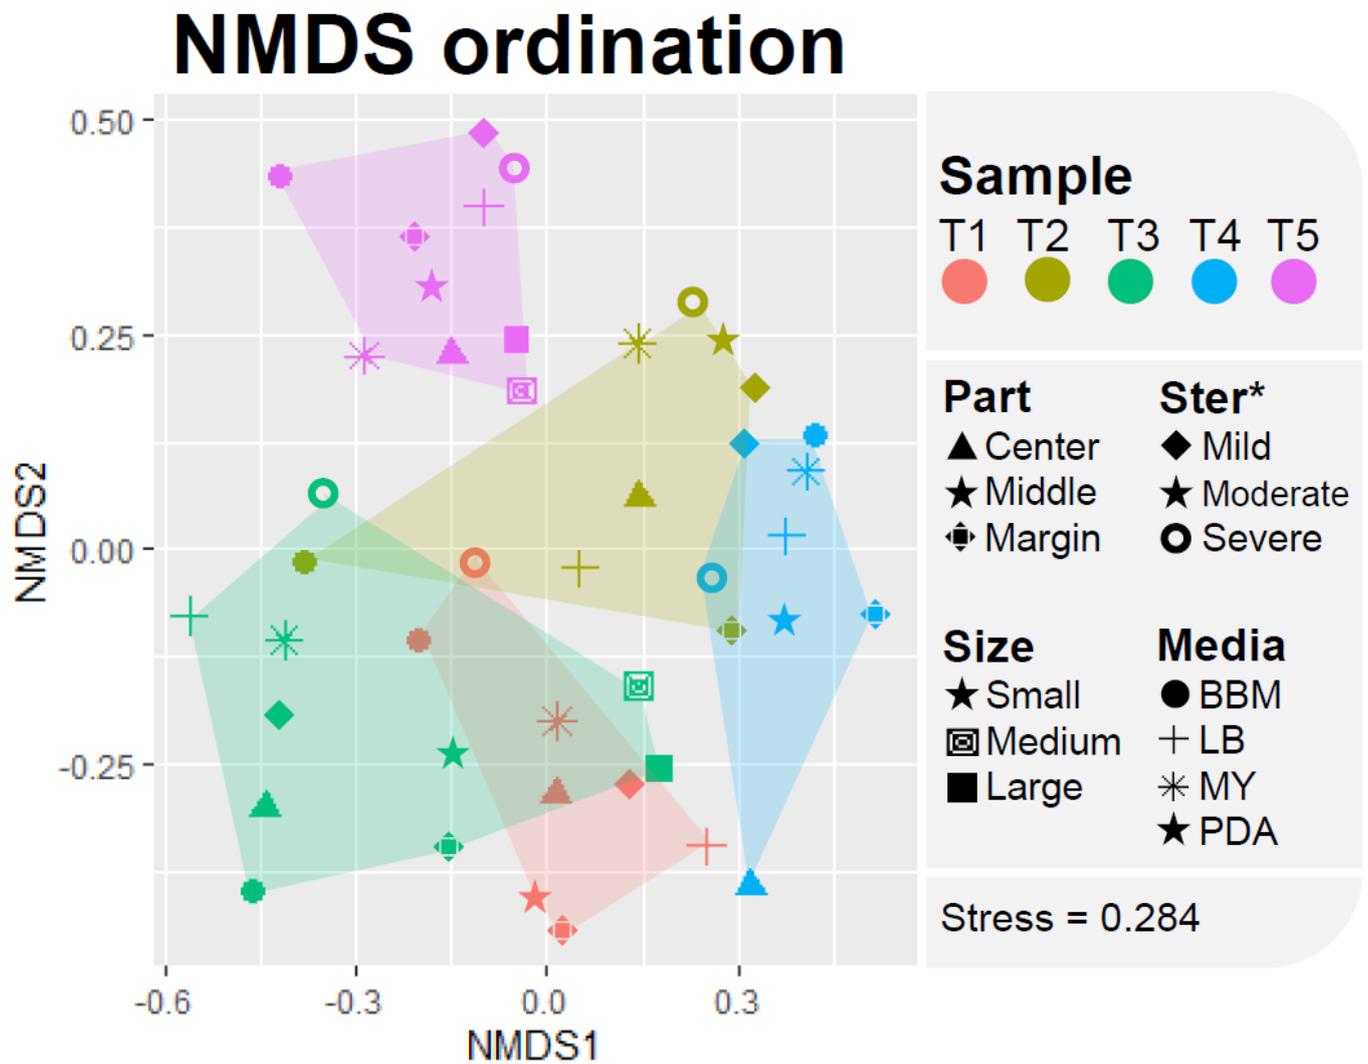

Figure S4. NMDS ordination of isolated ELF community. Each thallus sample is represented in different colors of symbols. The different isolation conditions are represented in different symbols. The stress value is on the right-downside. Ster*, Sterilization.
