

Supplementary Figure S1. Effect of BM and/or MSB on microbial growth. Growth of WT or KO in YPD broth with or without 12 h 2 mM BM treatment was monitored based on OD₆₄₀ measurements. MSB was added at 0 h in 0.5 mM final concentration to half of the samples. Data represent mean \pm SD values calculated from 3 independent experiments.

^a Significant difference between untreated KO vs untreated WT and treated KO vs treated WT

^b Significant difference between treated WT vs untreated WT and treated KO vs untreated KO

^c Significant interaction between the effects of BM and MSB according to two-way ANOVA.
