Table S1. Genome size estimation for *I. hispidus* NPCB_001.

Item	Number
Heterozygosity	0.922%
Genome Haploid Length	33,688,229 bp
Genome Repeat Length	8,699,429 bp
Genome Unique Length	24,988,801 bp
Model Fit	96.598%
Read Error Rate	0.051%

Genome Haploid Length is genome size, **Genome Repeat Length** is the length of repeat sequences, **Genome Unique Length** is the length of non-repeated sequences, **Read Error Rate** is read error rate.

Table S2. Statistics of Oxford Nanopore PromethION sequencing data volume of *I. hispidus* NPCB_001 genome.

Rank	Flag	TotalBase	TotalReads	MaxLen	AvgLen	N50	L50	N90	L90	meanQ
0	all	8,044,663,434	1,481,781	280,975	5,429.05	23,187	98,450	1,803	689,957	11.30
0	pass	7,813,963,986	1,427,135	173,179	5,475.28	23,402	95,157	1,815	662,852	11.49
0	fail	230,699,448	54,646	280,975	4,221.7	15,682	3,492	1,500	27,513	6.27
5000	all	6,097,918,399	288,273	280,975	21,153.27	32,182	62,976	9,053	196,294	11.39
5000	pass	5,938,786,064	279,676	173,179	21,234.52	32,292	61,191	9,102	190,325	11.55

50000	fail	29,809,997	462	280,975	64,523.8	61,736	193	52,232	404	6.26
100000	all	57,844,930	510	280,975	113,421.43	109,354	233	101,465	453	10.85
100000	pass	55,687,999	494	173,179	112,728.74	109,273	227	101,426	439	11.02
100000	fail	2,156,931	16	280,975	134,808.18	130,776	7	104,804	14	5.78

Rank is the gradient of data length, **0** is that all data; **Flag** is data type, **all** is all sequencing data, **pass** is effective sequencing data, **fail** is filtration data; **TotalBase** is the number of base; **TotalReads** is the number of reads; **MaxLen** is maximum length of data; **AvgLen** is average length of data; **N50** is N50 of data, all reads are summed in order from long to short, and when additive length up to half of all reads total length, the last read length added is N50; **L50** is L50 of data, all reads are accumulated in turn ranking in order from long to short, when additive length up to half of all reads total length, the number of sequences is L50; **N90** is N90 of data, algorithm the same as N50; **L90** is L90 of data, algorithm the same as L50; **meanQ** is mean quality value.

Table S3. Statistics of Illumina NovaSeq sequencing data volume information of *I. hispidus* NPCB_001 genome.

Sample_name	Total_reads	Total_bases	GC_content	Q20	Q30
rawdata	38,199,760	5,729,964,000	47.76%	97.85%	93.72%
cleandata	38,199,760	5,729,964,000	47.76%	97.85%	93.72%

Sample name is data type; **Total_reads** is sequencing reads number; **Total_bases** is total sequencing base number; **GC_Content** is G/C base number as a percentage of total base number; **Q20**、**Q30** respectively are Phred value greater than 20、30 base as a percentage of total base.

Table S4. Statistics of Illumina NovaSeq sequencing data mapping of *I. hispidus* NPCB_001 genome.

Type	Number
map_rate	97.91%
Average_depth	163.36
Coverage	99.86%

map_rate is Illumina NovaSeq sequencing data mapping rates; **Average_depth** is average coverage depth; **Coverage** is coverage rate.

Table S5. Annotation Statistics of *I. hispidus* NPCB_001 coding gene.

Type	Number
the total number of gene	12,304
the average of mRNA_length	1,816.15
the average of cds_length	1,434.49
the average of exon_number	6.40
the average of exon_length	224.07
the average of intron_length	70.65
the total number of exon	78,769
the total number of intron	66,465
the total intron length	4,695,439

the total number of gene is the total number of genes; **the average of mRNA_length** is the average length of mRNA; **the average of cds_length** is the average length of CDS; **the average of exon_number** is the average number of exons per gene. **the average of exon_length** is the average exon length; **the average of intron_length** is the average intron length; **the total number of exon** is the total number of exons; **the total number of intron** is the total number of introns; **the total intron length** is the total intron length.

Table S6. Statistics of non-coding RNA annotation results in *I. hispidus* NPCB_001 genome.

Class	number	totalLen(bp)	meanLen(bp)
rRNA	14	25,246	1,803
sRNA	1	344	344
snRNA	16	1,962	122
tRNA	105	8,353	79

rRNA is ribosomal RNA; tRNA is transport RNA; sRNA is small regulatory RNA; snRNA is nucleolar small RNA. **totalLen** and **meanLen** are the total length and mean length.

Table S7. Statistics of *I. hispidus* NPCB_001 repetitive sequence annotation results.

Item	Subfamily	Number	Length(bp)	Coverage
SINE	/	2	162	0.00%
LINE	/	233	20,701	0.06%
LTR	/	1,384	747,007	2.20%
LTR	Gypsy	1,076	656,064	1.93%
LTR	Copia	226	85,202	0.25%
DNA	/	407	77,360	0.23%
Satellite	/	7	486	0.00%
Simple_repeat	/	5,023	201,468	0.59%
Low_complexity	/	857	40,901	0.12%
Other	/	40	8,243	0.02%
Unknown	/	34	7,413	0.02%
Total	/	7,987	1,100,314	3.23%

SINE is short scattered element; **LINE** is Long scattered element; **LTR** is long terminal repetition, mainly include two types, Gypsy and Copia; **DNA** is transposons; **Satellite** is satellite repetitive sequence; **Low_complexity** is Low_complexity repetition; **Other** is other types repetition; **Unknown** is unknown repetitive sequence; **Total** is total repetitive sequence.

Table S8. Statistics of *I. hispidus* NPCB_001 protein-coding gene annotation.

Item	Count	Percentage
Uniprot	5,760	46.81%
Pfam	8,401	68.28%
Refseq	4,295	34.91%
Nr	10,580	85.99%
Interproscan	8,401	68.28%
GO	5,719	46.48%
KEGG	3,900	31.70%
Pathway	2,375	19.30%
COG	1,051	8.54%
Annotation	10,814	87.89%
All	12,304	100%

Annotation is the gene with at least one annotation; Uniprot is the gene annotated to the Uniprot database; Pfam is the gene that is annotated to the Pfam database; Refseq is the gene that is annotated to the Refseq database; Nr is the gene that is annotated to the Nr database; Interproscan is the gene that is annotated to the Interproscan GO is the gene annotated to the GO database; KEGG is the gene that is annotated to the KEGG database; Pathway is the gene that is annotated to the KEGG Pathway database; COG is the gene that is annotated to the COG database.

Table S9. Candidate genes for mating type in *I. hispidus* NPCB_001 genome.

Top Annotation	Gene ID	Species	E -Value	Accession Number
mitochondrial intermediate peptidase (MIP)	g1048	<i>Schizosaccharomyces pombe</i>	3e ⁻⁵²	Q9Y7U6.1
unknown conserved fungal protein-codon gene (<i>βFG</i>)	g9997	<i>Fomitiporia mediterranea</i>	2e ⁻⁷⁰	EJD03593.1
homeodomain protein	g1045	<i>Kluyveromyces lactis</i>	1e ⁻⁵⁶	P07921.1
	g1047	<i>Sanghuangporus baumii</i>	3e ⁻¹⁰³	OCB84704.1
HD1 mating type protein	g1046	<i>Fomitiporia mediterranea</i>	9e ⁻⁴⁸	EJD06593.1
pheromone receptors (<i>ste3</i>)	g3868	<i>Schizophyllum commune</i>	6e ⁻⁶¹	P56502.2
	g3904	<i>Schizophyllum commune</i>	8e ⁻⁵³	P56502.2
	g4149	<i>Schizophyllum commune</i>	2e ⁻⁹⁵	P56502.2
glycosyltransferase family 8 protein	g9996	<i>Rattus norvegicus</i>	4e ⁻⁴¹	O08730.4

Figure S1. ITS alignment of the strain NPCB_001.

A. ITS sequence of the strain NPCB_001. B. Comparison results of ITS of the strain NPCB_001 based on NCBI blastP. C. The ITS of strain NWAUFU-1 was aligned to *Inonotus hispidus* clone SH2.107 (MN699466.1).

Figure S2. *K*-mer Depth and *K*-mer Species Frequency Distribution Plot.

The blue line represents the actual *K*-mer curve, the black line is the *k*-mer curve estimated by the model, the yellow line is the *K*-mer curve corresponding to the unique data, the red line represents the error curve due to sequencing errors, and the dashed line represents speculation *K*-mer peak. Using the reads obtained by sequencing, *K*-mer-based analysis was used to estimate the genome size and heterozygosity. A *K*-mer refers to a sequence of *K* bp in length. Iteratively select a sequence of length *K* bases from a continuous sequence. If the length of the sequence is *L* and the length of the *K*-mer is *K*, then *L*-*K*+1 *K*-mers can be obtained. We take *K*-mers for the reads obtained by sequencing, and then count the frequency of each *K*-mer. According to the Lander waterman algorithm, the genome size (*G*) satisfies the following formula:

$$C_{base} = C_{k-mer} \times \frac{L}{L - K + 1}$$

$$G = \frac{n_{k-mer}}{C_{k-mer}} = \frac{n_{base}}{C_{base}}$$

C_{base} and C_{k-mer} are the expected depth of coverage and *K*-mer, and n_{base} and n_{k-mer} are the total number of bases and the total number of *K*-mers in the sequence. In the case of a certain amount of data, the depth frequency of *K*-mer is subject to Poisson distribution, so the peak of the *K*-mer depth frequency distribution is the corresponding depth, which is used as an estimate of the expected depth of *K*-mer.

Figure S3. Species distribution map of Nr database alignment to sequences.

According to the results of the Nr library match, the top 10 species were counted and the rest were classified as other species, and the distribution of these species was mapped according to their proportion.

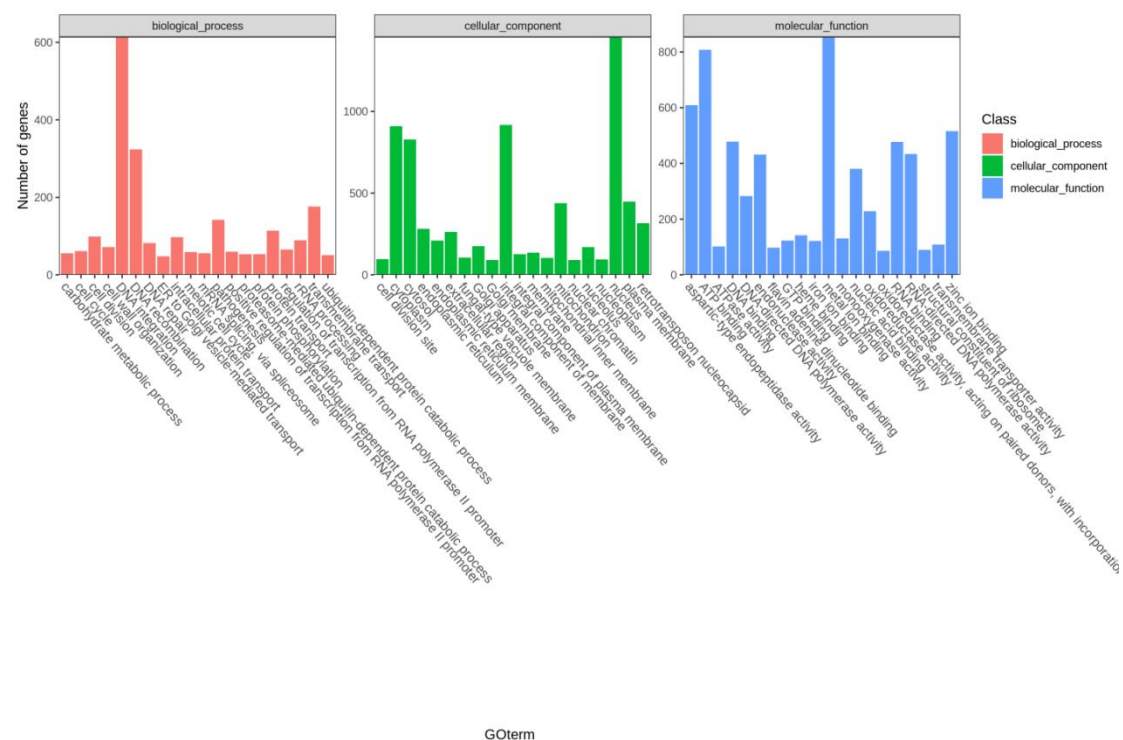

Figure S4. Statistical map of functional annotation classification based on Gene Ontology database.

Figure S5. Statistical Chart of COG Functional Annotated Classification.

Figure S6. KEGG Pathway Functional Classification Chart.

Figure S7. Domain annotation based on the Pfam database.

Statistical summaries of genes annotated for each domain are made and the top 20 most annotated domains are plotted.

Figure S10. P450s Cluster analysis of the strain *I. hispidus* NPCB_001 and other Basidiomycetes.

The sequences of the branch with color background and the corresponding sequence name without background are from Fungal Cytochrome P450 Database (<http://passport.riceblast.snu.ac.kr/?t=P450>). The background color of the branch corresponds to the category to which it belongs. The sequences with dark green background and corresponding branch without background are P450 sequences from *I. hispidus* NPCB_001. Multiple sequence pairs are implemented with mafft[3] v7.505 with parameters --maxiterate 1000 --localpair. The evolutionary tree was constructed by IQtree[4] v2.2.3 with the parameters -m MFP -bb 1000 -alrt 1000 -abays -nt AUTO.
