¹Internal Transcribed Spacer region; ² Number assigned to a particular environmental sample; ³Abundance of a singular sequence in a particular environmental sample; ⁴Total abundance of ITS sequences found in a particular environmental sample; ⁵Relative abundance of a singular ITS sequence in a particular environmental sample; ⁶Mean Annual Temperature (°C); ⁷Mean Annual Precipitation (mm).

Figure S1.

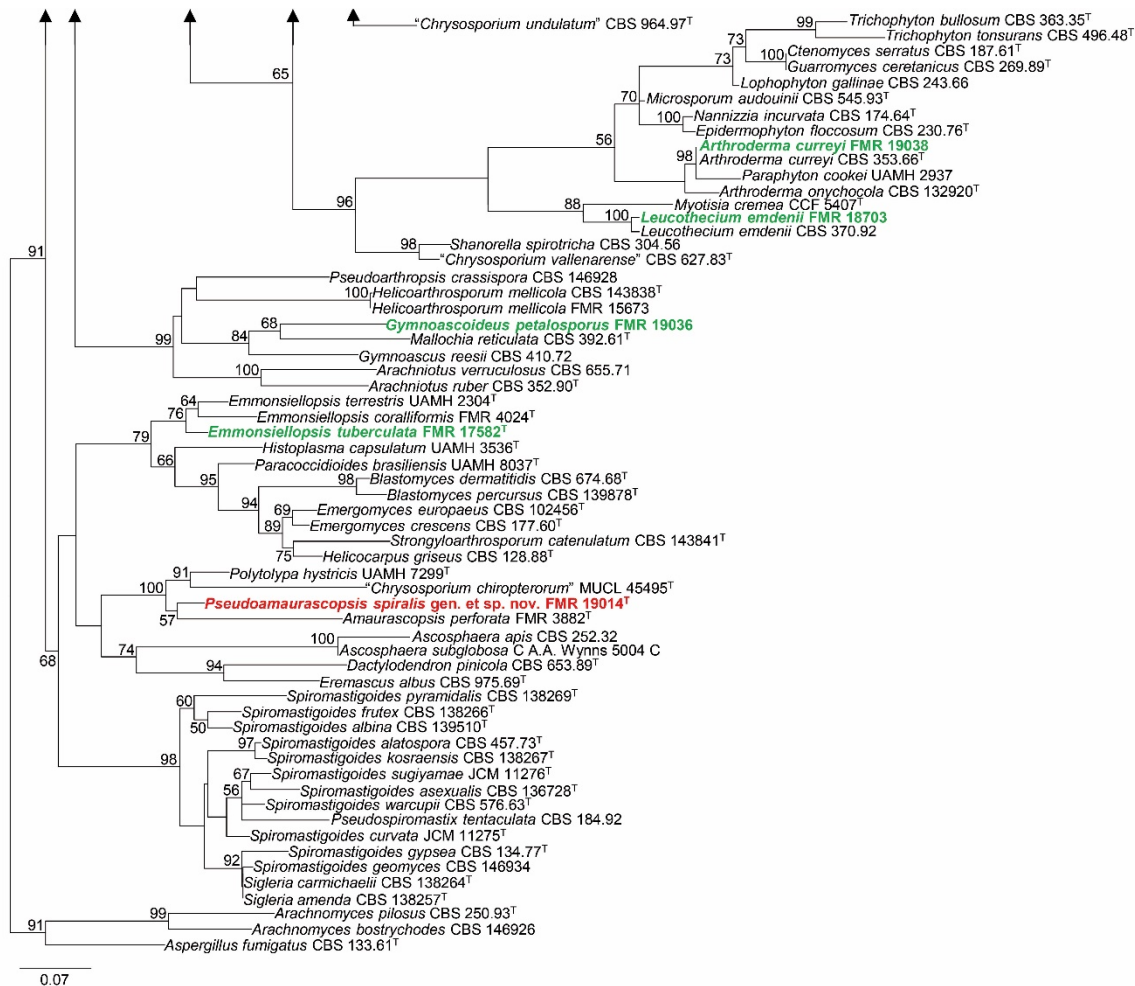

Figure S1. RAXML ITS tree of the order *Onygenales*, including the strains recovered from freshwater sediments studied in this work. The strains belonging to undescribed species or genera are in red and in bold. The strains belonging to known species are in green and in bold. Determined by MEGA software v.6, the best nucleotide substitution model for ML analysis was K2+G+I. The aligned data set was 598 bp long, with 440 variable sites and 373 phylogenetically informative. Branch lengths are proportional to phylogenetic distance. Bootstrap support values above 50% are indicated on the nodes. The tree was rooted to *Arachnomyces pilosus* CBS 250.93, *Arachnomyces bostrychodes* CBS 146926, and *Aspergillus fumigatus* CBS 133.61. Quote marks indicate species with unresolved taxonomy. ^T= Ex-type strain.

Fig. S2.
ITS phylotree of *Neoarthritisidaceae* fam. nov.
— Clade IV in Fig. 1

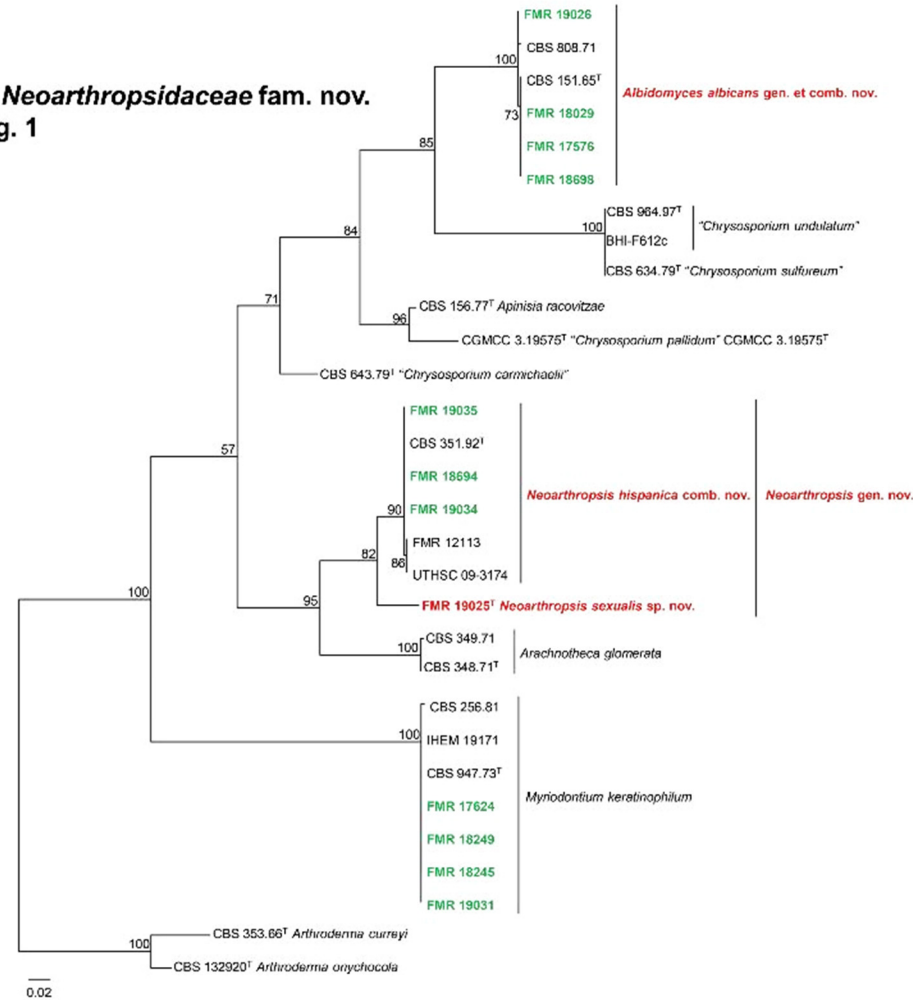

Figure S2. RAxML ITS tree of the family *Neoarthritisidaceae*, including the strains recovered from freshwater sediments studied in this work. New taxa proposed are in red and in bold; strains of known species identified in our study are in green. Determined by MEGA software v.6., the best nucleotide substitution model for ML analysis was K2+G. The aligned data set was 408 bp long, with 161 variable sites and 149 phylogenetically informative. Branch lengths are proportional to phylogenetic distances. Bootstrap support values above 70% are indicated on the nodes. The tree was rooted to *Arthroderma curreyi* CBS 335.66 and *Arthroderma onychocola* CBS 132920. ^T= Ex-type strain.

Figure S3.

ITS2

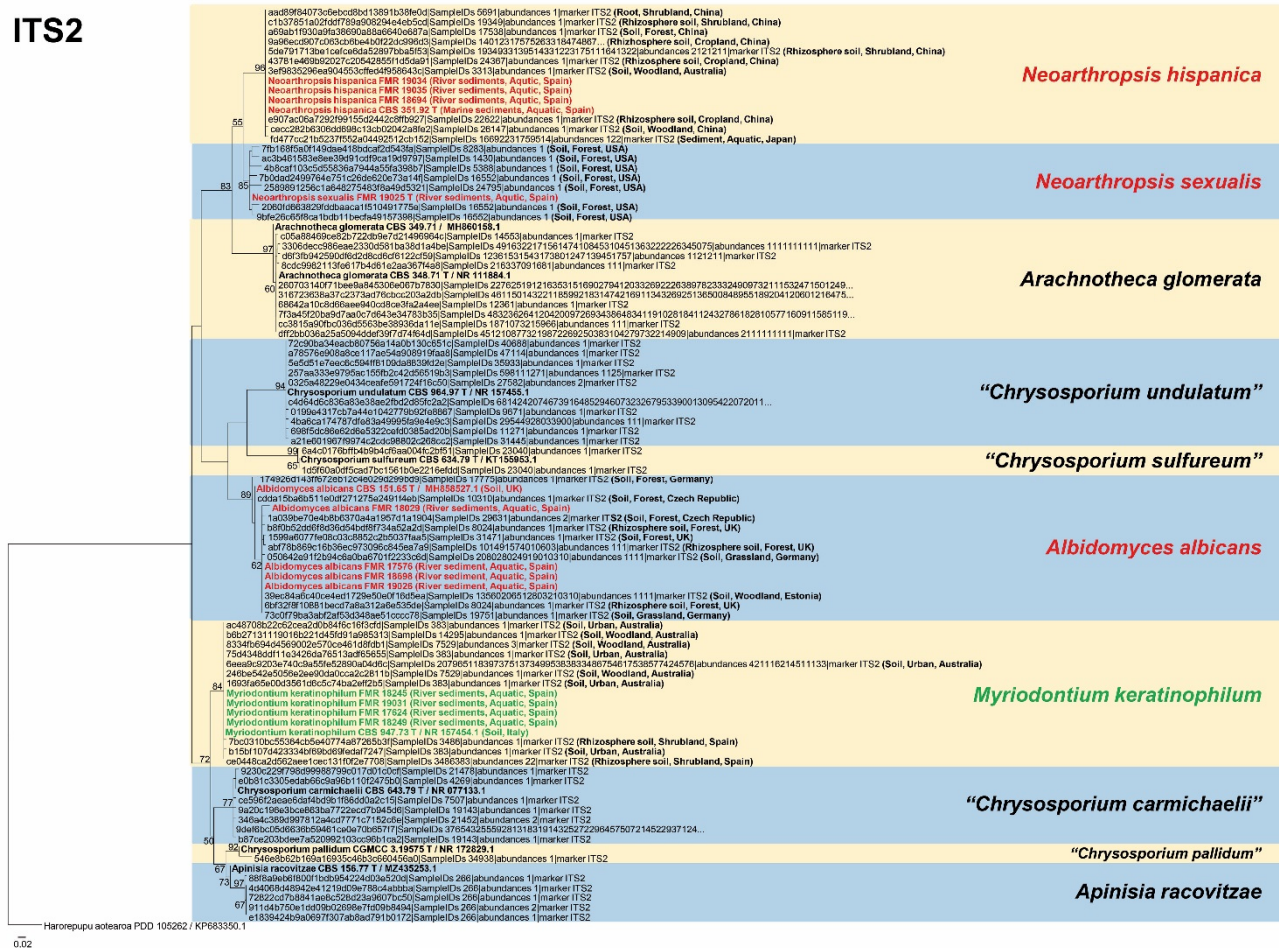

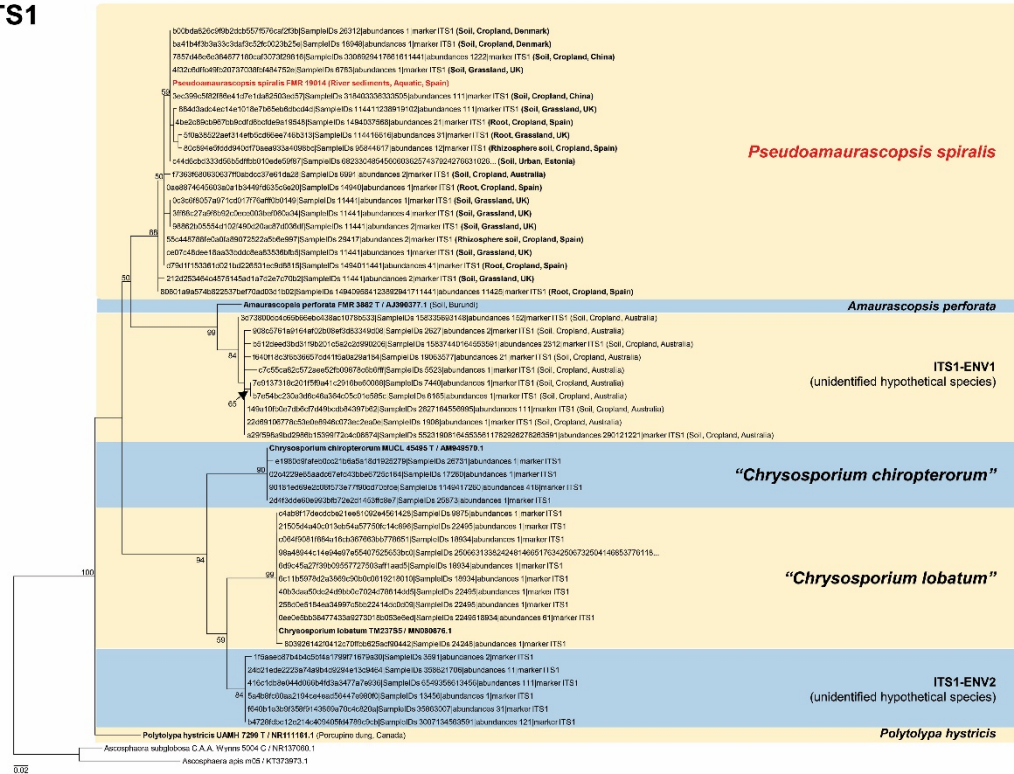

Figure S3. RAxML phylogenetic tree showing the relationships among species investigated in the new family *Neoarthropsidaceae*, and related ITS1/ITS2 environmental sequences deposited in the GlobalFungi database. Titles of sequences contain sequence and sample codes taken from GlobalFungi. ITS1/ITS2 sequences of novel taxa are in red. ITS1/ITS2 sequences of sediment isolates and ex-type strains of known species identified in this study are in green. ITS1/ITS2 sequences of known species retrieved from GenBank are in bold. Geographical and ecological information contained in environmental sequences associated to the novel taxa are written in bold. Determined by MEGA software v.6., the best nucleotide substitution model for ML analysis was K2+G for ITS1 and JC+G for ITS2. The alignments data sets were 381 bp long for ITS1 and 181 bp for ITS2; with 228 variable sites for ITS1 and 127 for ITS2; and 167 phylogenetically informative for ITS1 and 97 for ITS2. Branch lengths are proportional to phylogenetic distances. Bootstrap support values above 50% are indicated on the nodes. The trees were rooted to *Harorepupu aotearoa* PDD 105262. Quote marks indicate species with unresolved taxonomy. T= Ex-type strain.

Clade X (Fig. 1) ITS1

Clade X (Fig. 1) ITS2

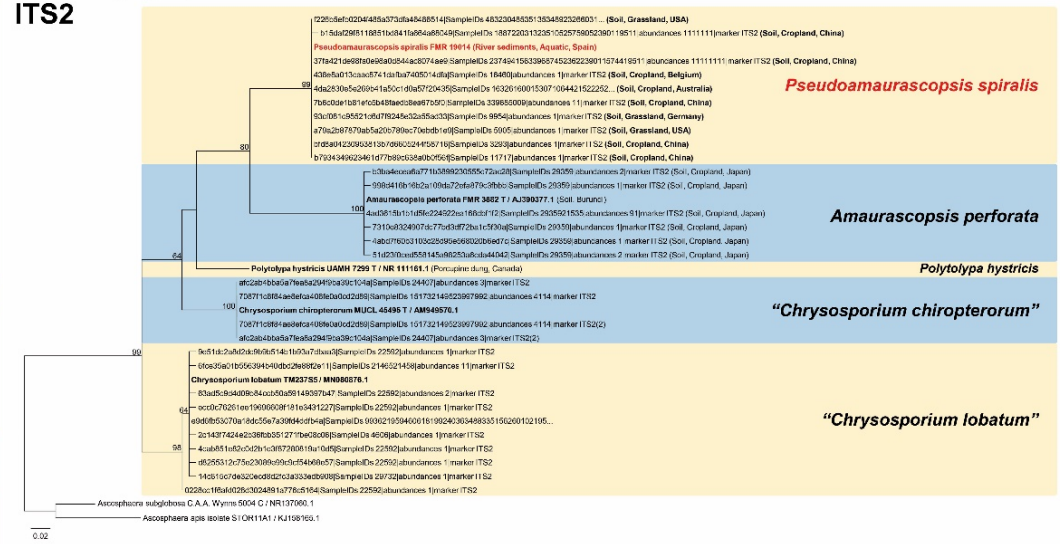

Figure S4. RAxML phylogenetic tree showing the relationships among species investigated in the Clade X (*incertae sedis* at the family level), and related ITS1/ITS2 environmental sequences deposited in the GlobalFungi database. Titles of sequences contain sequence and sample codes taken from GlobalFungi. ITS1/ITS2 sequence of the novel genus *Pseudoamaurascopsis* is in red. ITS1/ITS2 sequences of known species retrieved from GenBank are in bold. Geographical and ecological information contained in environmental sequences associated to the novel genus are written in bold. Determined by MEGA software v.6., the best nucleotide substitution model for ML analysis was K2+G for ITS1 and T92 for ITS2. The alignments data sets were 208 bp long for ITS1 and 171 bp for ITS2; with 125 variable sites for ITS1 and 80 for ITS2; and 97 phylogenetically informative for ITS1 and 50 for ITS2. Branch lengths are proportional to phylogenetic distances. Bootstrap support values above 50% are indicated on the nodes. The trees were rooted to *Ascosphaera subglobosa* C.A.A. Wynns 5004 (C) and *Ascosphaera apis* m05. Quote marks indicate species with unresolved taxonomy. [†]= Ex-type strain.

Figure S5.

ITS1

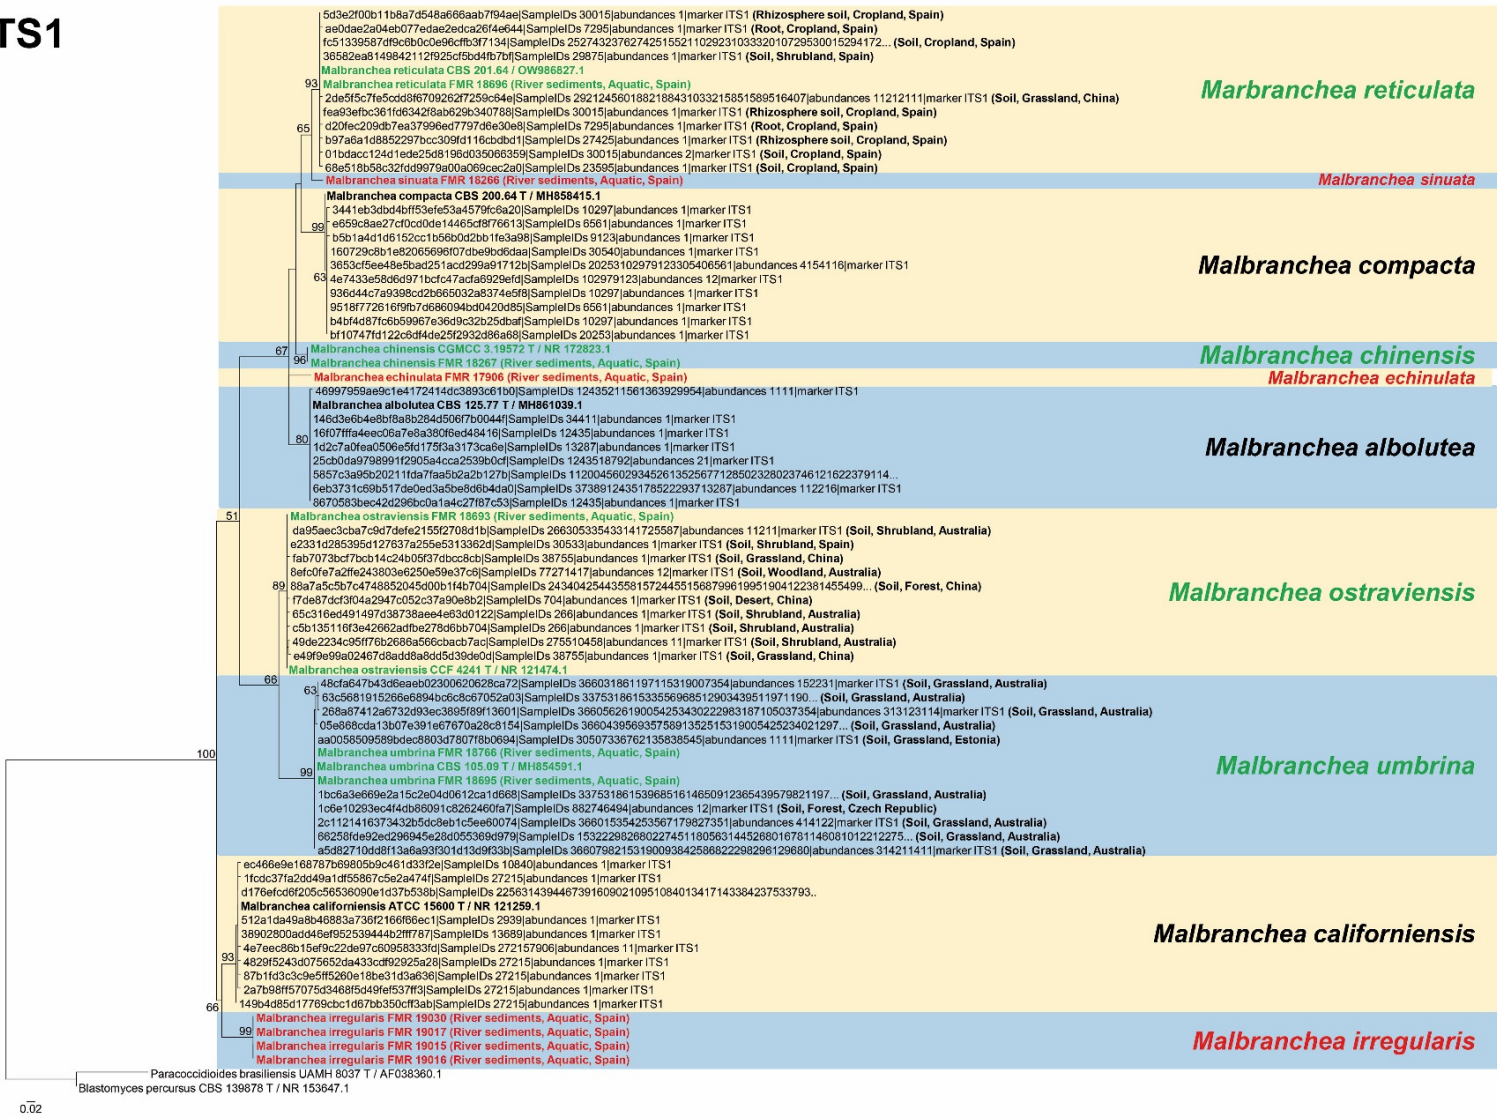

Figure S5.

Figure S5. RAxML phylogenetic tree showing the relationships among some species in the *Malbrancheaceae*, and related ITS1/ITS2 environmental sequences deposited in the GlobalFungi data base. Titles of sequences contain sequence and sample codes taken from GlobalFungi. ITS1/ITS2 sequences of novel *Malbranchea* species are in red. ITS1/ITS2 sequences of sediment isolates and ex-type strains of known species identified in this study are in green. ITS1/ITS2 sequences of known species retrieved from GenBank are in bold. Geographical and ecological information contained in environmental sequences associated to the novel taxa are written in bold. Determined by MEGA software v.6., the best nucleotide substitution model for ML analysis was K2+G for ITS1 and T92+G for ITS2. The alignments data sets were 315 bp long for ITS1 and 149 bp for ITS2; with 148 variable sites for ITS1 and 77 for ITS2; and 134 phylogenetically informative for ITS1 and 66 for ITS2. Branch lengths are proportional to phylogenetic distances. Bootstrap support values above 50% are indicated on the nodes. The trees were rooted to *Paracoccidioides brasiliensis* UAMH 8037 and *Blastomyces persicus* CBS 139878. [†]= Ex-type strain.
