Mass of sorbed MilliQ water (pH 5.5) measured as a function of time at 21.0 ± 0.5 °C with Krüss K100 tensiometer.

Figure S6. Mass of dried sample, mass of sorbed Milli-Q water and swelling degree (SD) at equilibrium determined for HPMC (blank), and HPMC cryogels prepared with the lowest (K0.5 and AOT 0.5) and highest (K7.25 and AOT7.25) surfactant concentration.

Figure S7. Reduced viscosity η_{sp}/c as a function of HPMC J12MS concentration. Intrinsic viscosity ($[\eta]$) is the intercept of the fitted linear curve. M_v is the viscometric average molar mass and can be obtained by using the Mark-Houwink-Sakurada equation, $[\eta] = KM_v^a$, where K and a are constants. $K = 0.000172$ and $a = 0.838$ for the HPMC-water system [38], resulting in $M_v = 3.46 \times 10^5 \text{ g.mol}^{-1}$.

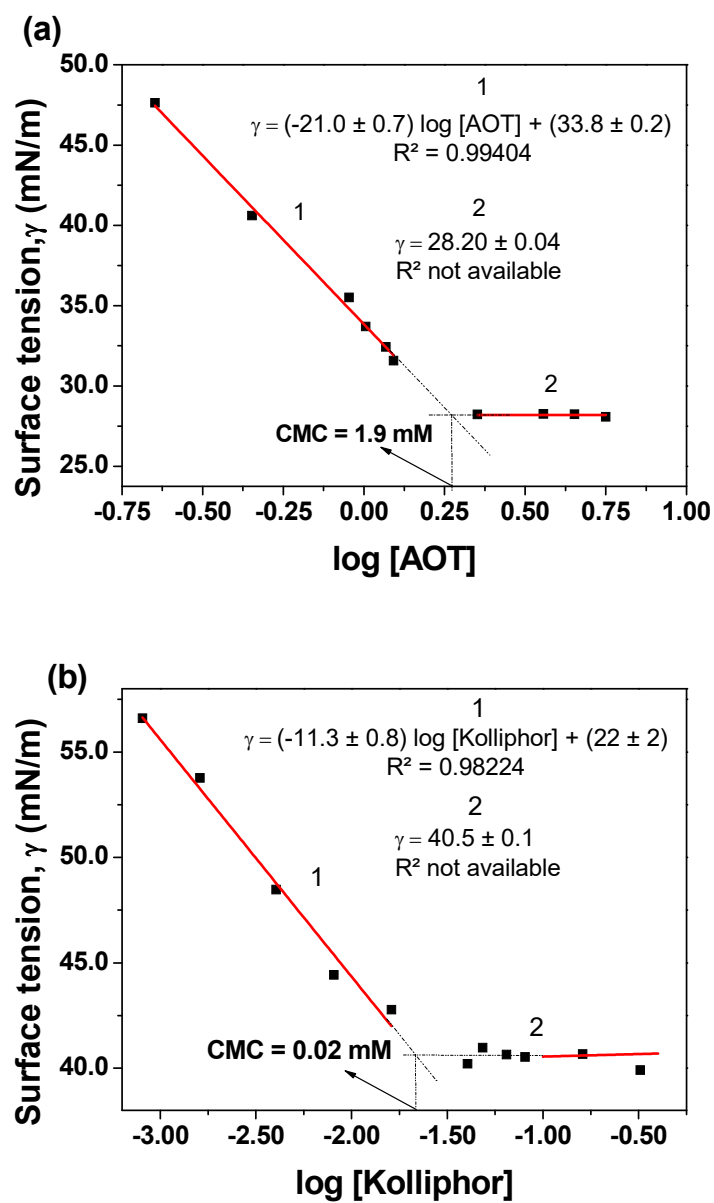

Figure S8. Surface tension (γ) vs logarithm of the concentration (mM) of (a) AOT and (b) Kolliphor® EL aqueous solutions, determined at 21 ± 1 °C, by Du Noüy ring method in a Krüss K100 tensiometer.
