The data represent average values of 12 tests. Different letters (a–d) in the same column indicate significant differences between cultivars, according to LSD test, at  $p < 0.05$ . Different letters (x–z) in the same row indicate significant differences between starter dosage within each cultivar, according to LSD test, at  $p < 0.05$ .

**Table 4.** Significance of the differences in mean values of quality and proximate analysis parameters of tempeh in the post hoc LSD test ( $p < 0.05$ ).
