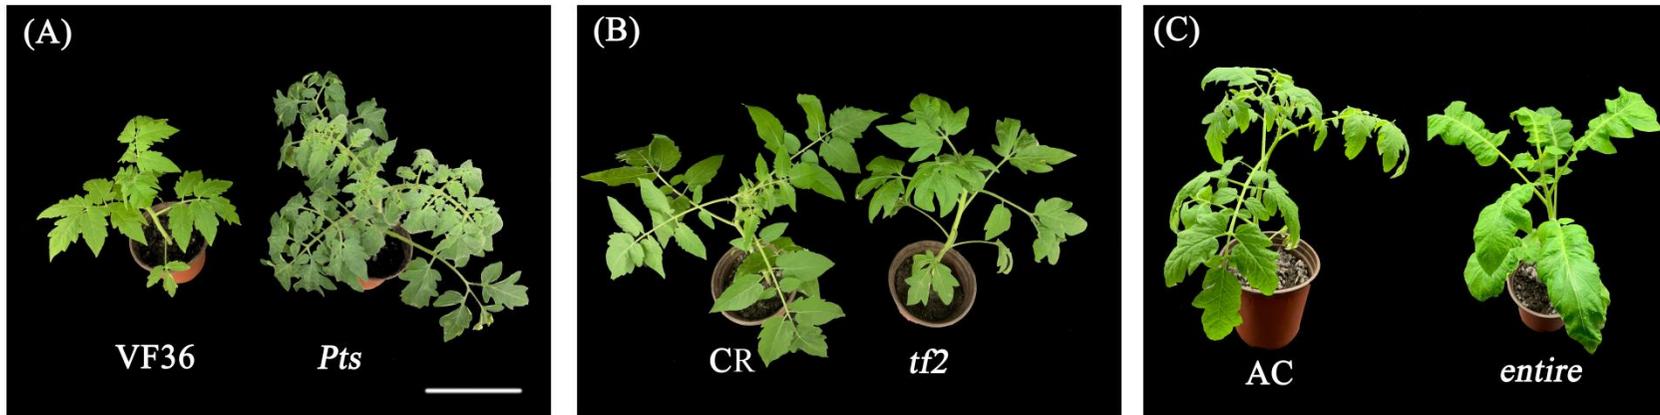

Figure S1. Morphological differences between mutant and wild-type plants. (A–C) 45-d-old plants. Bars=500  $\mu$ m in (A–F).

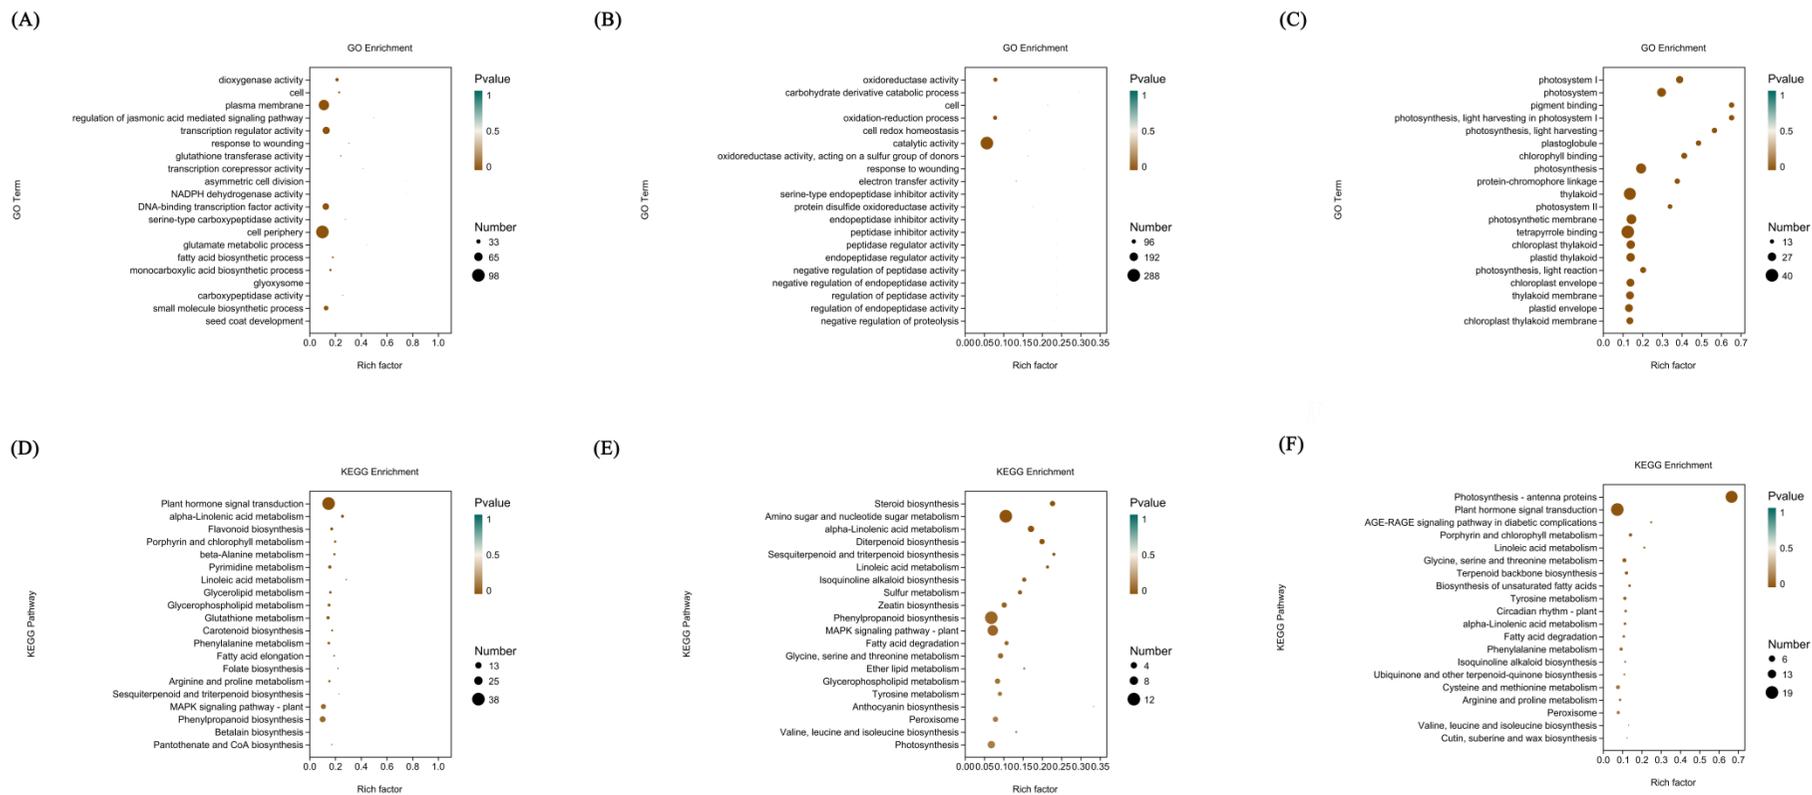

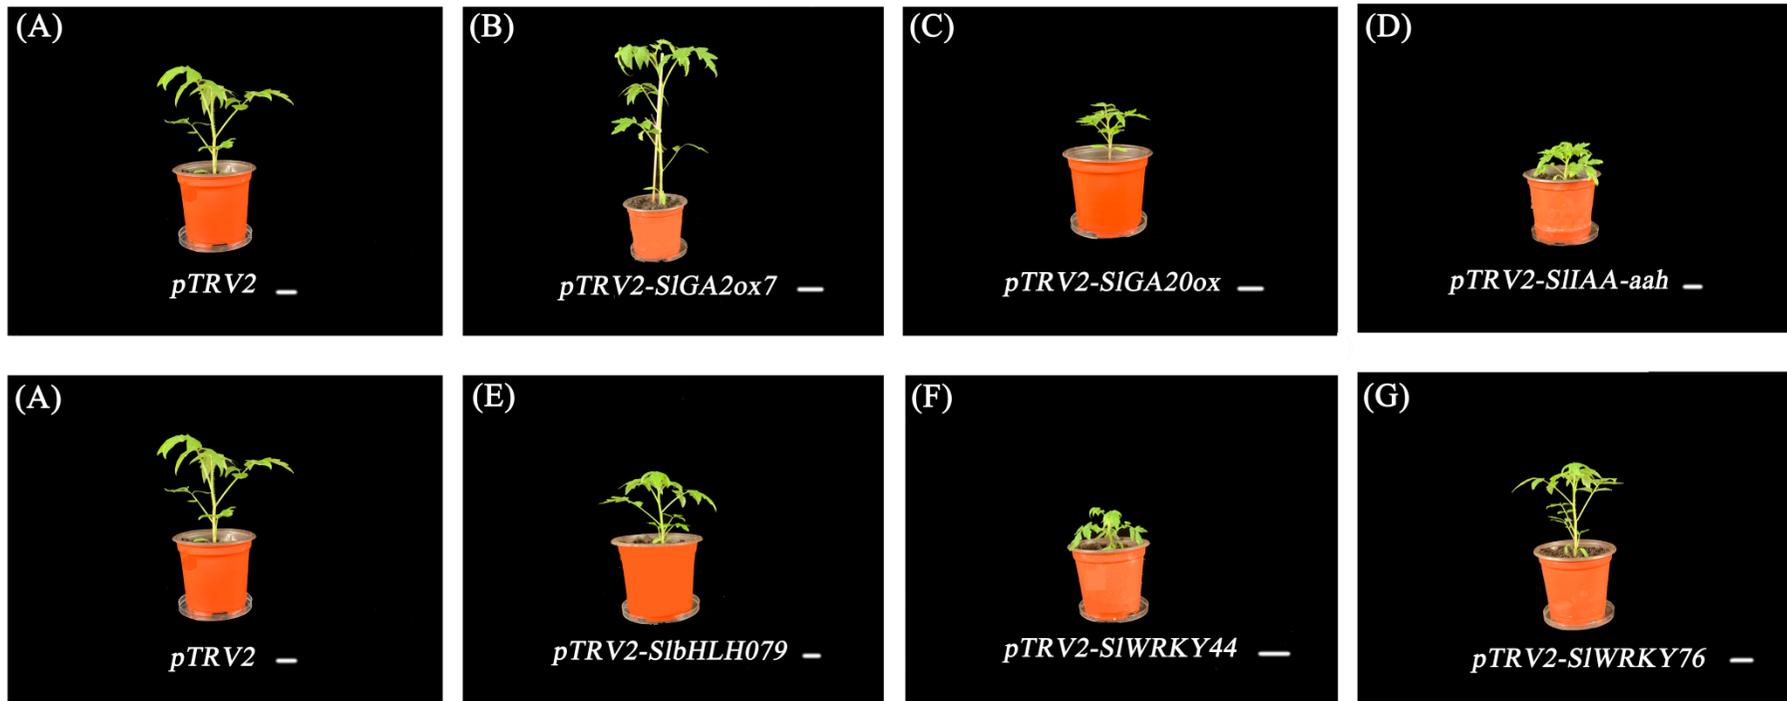

Figure S2. Go and KEGG enrichment analysis. (A–C) The abscissa is the rich factor (number of differentially annotated genes to the GO Term/total number of genes annotated to the GO Term), and the ordinate is the GO Term. The size of the midpoint in the figure represents the number of differentially annotated genes (upregulated or downregulated, which is related to the gene set selected during analysis) in the corresponding Term. The depth of the color indicates the level of significance. (A–C) *Pts/VF36*, *tf2/CR*, *e/AC*, respectively. (D–F) The abscissa is the Rich factor (number of differentially annotated genes into Pathway/total number of genes annotated into Pathway), and the ordinate is the Pathway. The size of the midpoint in the figure represents the number of differentially annotated genes (upregulated or downregulated, which is related to the gene

set selected during analysis) in the corresponding Pathway. The depth of the color indicates the level of significance. (D–F) Pts/VF36, tf2/CR, e/AC, respectively.

**Figure S3.** Differences in leaf morphology of VIGS plants compared with that of pTRV2 plants. (A–G) Height of VIGS and pTRV2 plants at 45 d. pTRV2 plants were used as the control. Bars = 4 cm.

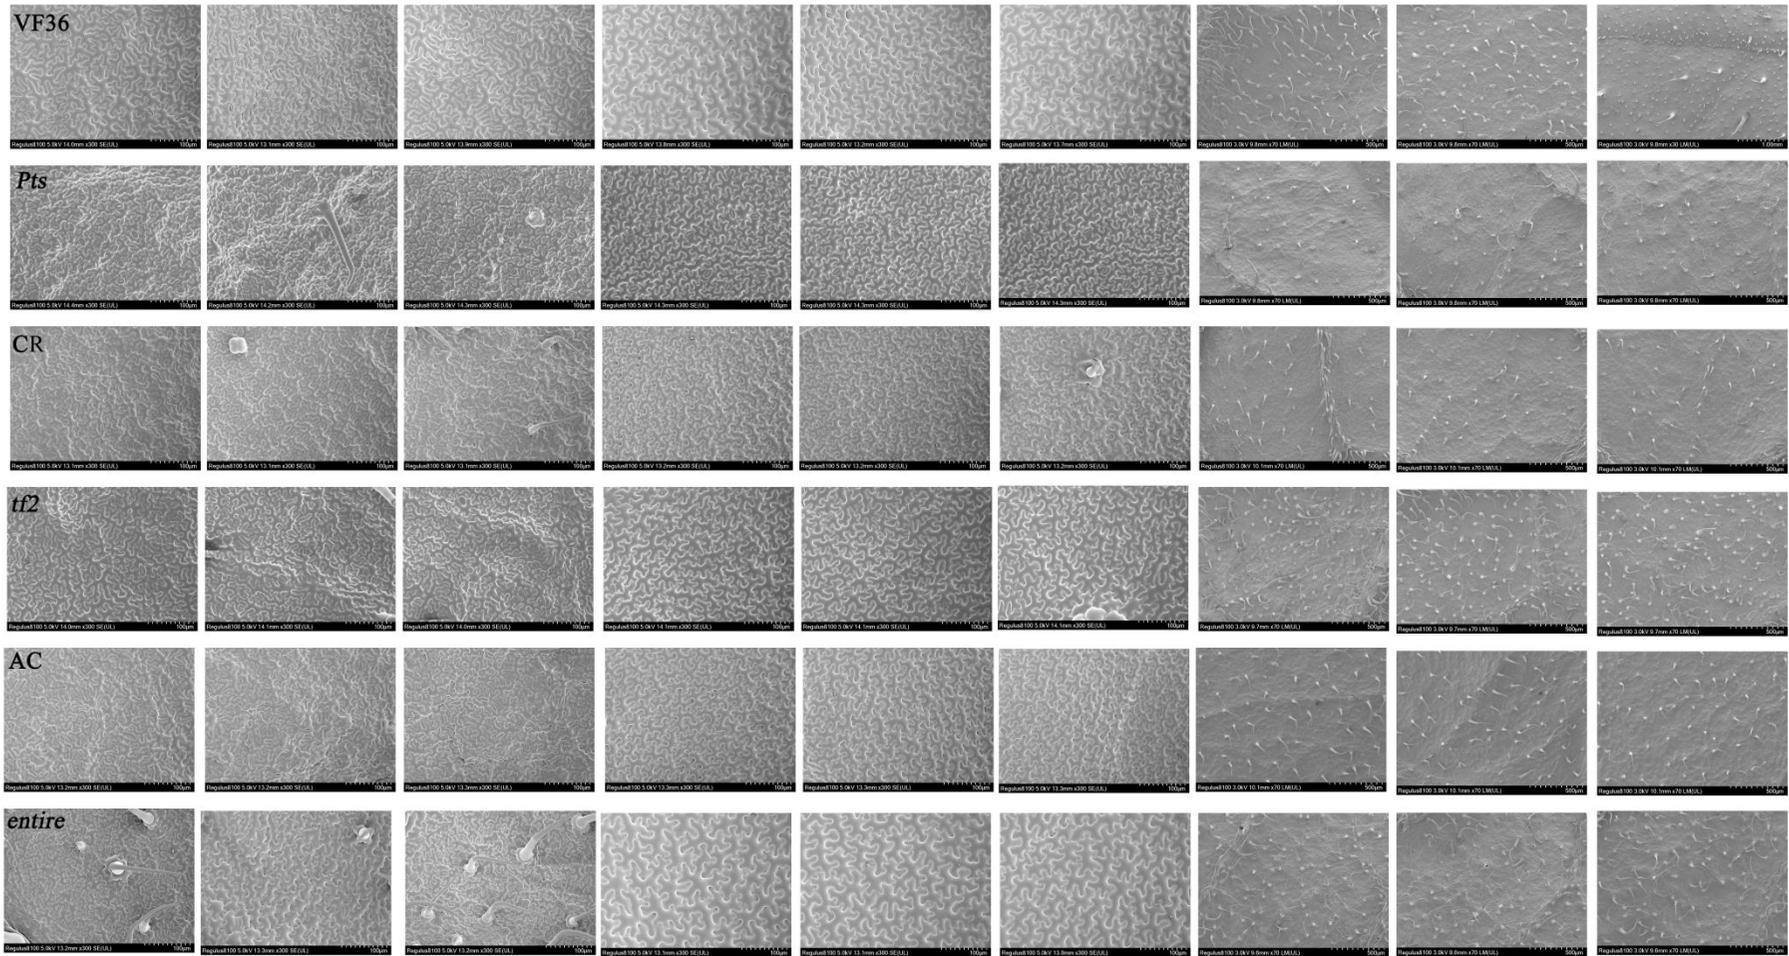

Figure S4. Stomata, epidermal cells, leaf hair supplement.
