

Figure S2. The effects of plasma-activated simulated seawater (PASW) on *E. coli* in oysters during static depuration in a preliminary experiment. Data shown are the mean values \pm standard errors of three replications. Means lacking a common lowercase letter are significantly different ($p < 0.05$) at a specific time point amongst treatments. Means lacking a common uppercase letter are significantly different over the 24 h processing period ($p < 0.05$).
