(i) The process of purging the chitosan solution for 30 minutes before adding the precursor $\text{Tb}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$

(ii) Stirring the solution for 2.5 hours after adding the precursor $\text{Tb}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$

(iii) The color of the solution changed to yellowish white after adding sodium sulfide solution to the preparation of Tb_2S_3 QDs with chitosan as a capping agent.

(iv) Heating the solution after adding ammonium hydroxide (NH_4OH) to the preparation of Tb_2S_3 with chitosan as a capping agent.

Figure S1. The process for preparing CS- Tb_2S_3 QDs by the wet-chemical method (steps i – v); whereas step (v) represents storage of the purified CS- Tb_2S_3 nanoparticles in ultrapure water.

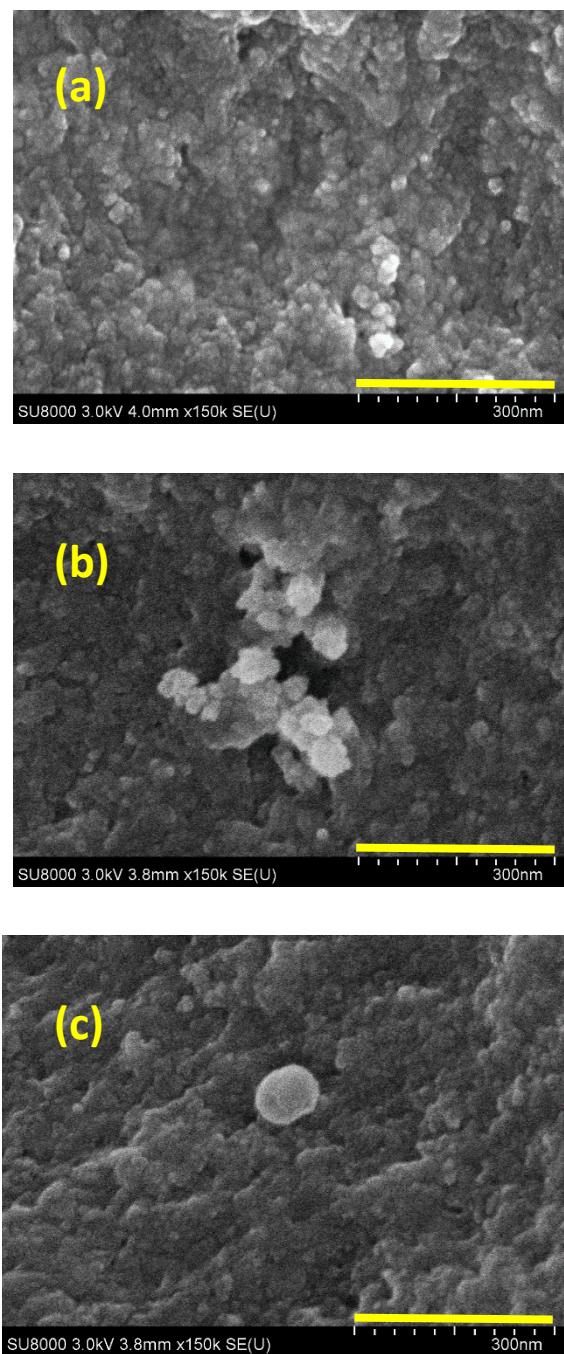

Figure S2. SEM images of different sample regions of the CS-Tb₂S₃ nanocomposites prepared at pH 10: (a) region 1, (b) region 2, and (c) region 3. Scale bar (300 nm) and magnification (150k \times) with chromium staining.

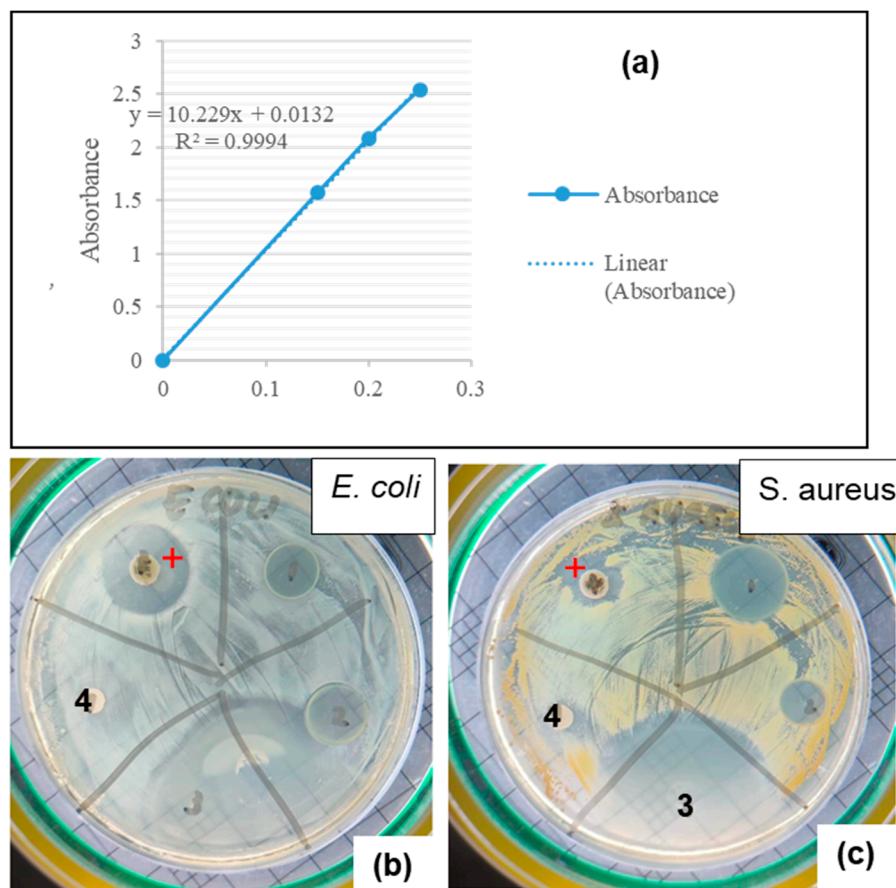

Figure S3. (a) Standard Curve of CS-Tb₂S₃ QDs in Phosphate Buffer Solution (PBS), (b) Comparison antibacterial activity of europium nitrate salt (1), terbium nitrate salt (2), zinc nitrate salt (3), chitosan (4) and positive control (+; tetracycline) towards *E. coli*, and (c) Comparison antibacterial activity of europium nitrate salt (1), terbium nitrate salt (2), zinc nitrate salt (3), chitosan (4) and positive control (+; tetracycline) towards *S. aureus*.

XPS Results for Terbium Sulfide Nanocomposites
