Highlights

What are the main findings?

- Smart governance is a critical driver of sustainable urban development, enhancing operational efficiency, service delivery, and participatory decision-making.
- The effectiveness of smart governance is shaped by key enablers and barriers, including digital infrastructure, data governance, citizen participation, and institutional capacity.
- A multidimensional framework that integrates governance, technology, and sustainability provides a comprehensive lens for understanding and guiding urban transformation.

What are the implications of the main findings?

- Policymakers must prioritize digital inclusion, robust data governance, and institutional innovation to build inclusive, secure, and resilient smart cities.
- Strategically aligning smart governance initiatives with the sustainable development goals (SDG)—particularly SDG 11—can support the creation of equitable and sustainable urban futures.

Abstract

Smart governance—the integration of digital technologies into urban governance—is increasingly recognized as a transformative approach to addressing complex urban challenges such as rapid urbanization, climate change, social inequality, and resource constraints. As a foundational pillar of the smart city paradigm, it enhances decision-making, service delivery, transparency, and civic participation through data-driven tools, digital platforms, and emerging technologies such as AI, IoT, and blockchain. While often positioned as a pathway toward sustainability and inclusivity, existing research on smart governance remains fragmented, particularly regarding its relationship to urban sustainability. This study addresses that gap through a systematic literature review using the PRISMA methodology, synthesizing theoretical models, empirical findings, and diverse case studies. It identifies key enablers—such as digital infrastructure, data governance, citizen engagement, and institutional capacity—and highlights enduring challenges including digital inequity, data security concerns, and institutional inertia. In response to this, the study proposes a multidimensional framework that integrates governance, technology, and sustainability, offering a holistic lens through which to understand and guide urban transformation. This framework underscores the importance of balancing technological innovation with equity, resilience, and inclusivity, providing actionable insights for policymakers and planners navigating the complexities of smart cities and urban development. By aligning smart governance practices with the United Nations’ sustainable development goals (SDG)—particularly

SDG 11 on sustainable cities and communities—the study offers a strategic roadmap for fostering resilient, equitable, and digitally empowered urban futures.

Keywords: smart governance; urban governance; participatory governance; data governance; smart cities; digital transformation; responsible innovation; urban sustainability; sustainable cities; sustainable development goals

1. Introduction and Background

The concept of smart governance has emerged as a transformative paradigm for addressing the growing complexities of urban management in the face of rapid urbanization, climate change, resource depletion, and increasing socioeconomic inequality [1–5]. In an era where cities are becoming focal points of economic activity and population growth, the traditional models of governance—often characterized by centralized decision-making, bureaucratic inertia, and limited civic engagement—are increasingly inadequate for responding to contemporary urban challenges. Smart governance, in contrast, offers a forward-looking alternative that leverages digital technologies, real-time data, collaborative policy design, and citizen participation to enhance governance outcomes in urban contexts [6,7].

Defined as the strategic integration of digital innovation, data-driven decision-making, participatory governance mechanisms, and adaptive regulatory frameworks, smart governance aims to improve the efficiency, transparency, responsiveness, inclusivity, and long-term sustainability of public administration [8–10]. By fostering a networked model of urban governance that brings together governments, citizens, businesses, and civil society actors, it enables more informed policy formulation, optimized resource allocation, improved public service delivery, and enhanced civic trust. At its core, smart governance reflects a paradigm shift, replacing static, top-down approaches with agile, participatory, and technologically enabled systems of urban management.

Importantly, smart governance is not solely about technology; rather, it represents an institutional and normative transformation. While digital tools such as AI, IoT, and big data analytics underpin smart governance infrastructures, the objective extends beyond operational optimization [11]. The ambition is to realign urban governance with the principles of sustainability—broadly defined to include environmental protection, social equity, and economic resilience [12–14]. In this sense, smart governance supports the development of cities that are not only efficient and innovative but also inclusive, livable, and resilient in the face of ongoing social and ecological disruptions.

As cities grapple with infrastructural deficits, environmental degradation, income disparities, and heightened climate risks, the governance capacity to navigate these complex, interlinked challenges has become a decisive factor for the success of urban futures. Against this backdrop, the integration of smart governance into urban development agendas has been increasingly viewed as a critical enabler of sustainable development [15].

Advanced digital technologies offer unprecedented opportunities for real-time monitoring, predictive modelling, public engagement, and intersectoral coordination—capabilities that can significantly enhance governance performance. However, the transformative potential of smart governance lies not merely in its technical features but also in its ability to foster multi-stakeholder collaboration and systemic innovation across institutional boundaries [16–18].

A growing body of research has situated smart governance at the center of the urban sustainability discourse, particularly in connection with the United Nations sustainable

development goals (SDGs). Among these, SDG 11—focused on making cities inclusive, safe, resilient, and sustainable—explicitly underscores the need for innovative governance mechanisms to address the multidimensional challenges of urbanization [19–23]. Smart governance, with its emphasis on adaptive, participatory, and technologically integrated systems, is widely seen as a key lever for achieving SDG 11 and related urban goals.

While the concept of smart governance holds considerable promise, its implementation is fraught with complexity, and its operationalization remains highly uneven and context-dependent. Much of the current literature remains skewed towards technocentric analyses, focusing narrowly on infrastructure upgrades, digital platforms, and algorithmic optimization [24,25]. This tendency has contributed to a fragmented understanding of smart governance that often overlooks its broader socio-political dimensions. Issues of social equity, citizen empowerment, ethical data use, and institutional capacity are frequently marginalized in dominant smart governance discourses, raising concerns about inclusivity and justice in digital-city agendas.

This narrow focus reveals a significant gap in the literature: the absence of a comprehensive framework that addresses the complex relationship between smart governance and urban sustainability across multiple dimensions. As Fröhlich [26] and Yigitcanlar & Bulu [27] argue, there is an urgent need for research that goes beyond technical innovation to examine governance practices designed to promote inclusion, transparency, and environmental stewardship. Without such a multidimensional lens, smart governance risks becoming a technocratic exercise detached from the lived realities of urban populations—and marginalized groups whose needs may not align with dominant innovation narratives.

A key challenge in this regard is digital inclusivity. As cities adopt smart technologies, there is a growing risk that disadvantaged populations will be excluded from the benefits of digital transformation due to disparities in internet access, digital literacy, and technological infrastructure [24,28]. This digital divide can reinforce existing socio-economic inequalities and undermine the democratic promise of smart governance. Moreover, the deployment of surveillance technologies and large-scale data systems raises important questions about privacy, consent, and algorithmic bias—issues that demand robust regulatory frameworks and ethical safeguards.

The governance of data itself has become a contested terrain. As public and private actors increasingly collect, process, and monetize urban data, concerns have emerged about data ownership, transparency, and accountability. The potential for surveillance, discriminatory profiling, and misuse of personal information necessitates governance models that are both technologically competent and ethically grounded. These concerns are compounded by institutional inertia: Traditional governance structures often resist change, with entrenched interests and bureaucratic rigidity hindering innovation and reform [29,30]. As Müller [31] and Yigitcanlar & Kamruzzaman [32] note, realizing the potential of smart governance requires not only digital transformation but also cultural and organizational change within public institutions.

Urban governance must therefore be reimagined to reflect the dynamic and multi-faceted nature of contemporary cities. Cities are complex ecosystems characterized by diverse stakeholders, competing interests, and rapidly evolving challenges. Designing governance systems capable of responding to this complexity requires integrated approaches that consider the interdependencies among technological, social, economic, and environmental factors. While digital technologies can enhance efficiency and scalability, they must be embedded in participatory frameworks that reflect local values and community priorities [24].

Participatory governance models, which promote active citizen involvement in planning, budgeting, and service delivery, are increasingly seen as essential to the success of smart governance initiatives. They ensure that governance innovations are contextually relevant, socially legitimate, and democratically accountable. In this respect, smart governance must not only leverage technology but also cultivate trust, inclusivity, and civic agency. As Biermann et al. [15] and Clune & Zehnder [33] argue, urban sustainability can only be achieved through governance models that are both technologically proficient and socially equitable.

Despite its fragmented conceptual landscape, smart governance continues to gain traction in both academic and policy circles. The diversity of definitions and frameworks developed by scholars, governments, and international organizations reflects the interdisciplinary nature of the field as well as the lack of a unified conceptual foundation [34]. Most definitions continue to emphasize the technological dimensions of smart governance, including the deployment of IoT sensors, real-time analytics, and AI-enabled decision-making tools.

Yet, these accounts often downplay the socio-political aspects of governance, such as transparency, citizen empowerment, and procedural justice. A more balanced and integrative understanding is required to fully grasp the potential and limitations of smart governance in real-world urban contexts.

In response to these limitations, this paper aims to fill both conceptual and practical gaps in the smart governance literature by developing a multidimensional framework that identifies its key drivers, barriers, and outcomes. The framework is designed to support policymakers and urban planners in crafting governance strategies that are technologically sophisticated, socially inclusive, and environmentally sustainable. The methodological approach is based on a systematic review of interdisciplinary literature, drawing on empirical studies, theoretical models, and case-based evidence to synthesize insights from the intersecting domains of governance, technology, and sustainability [35].

This review reveals that while smart governance holds considerable promise as a driver of sustainable urban development, its effectiveness depends on how well it integrates diverse governance practices with principles of inclusivity, transparency, and resilience. Sustainable development cannot rely on technological innovation alone; rather, it requires a holistic approach that addresses governance institutions, policy frameworks, civic engagement, and socio-technical equity. By identifying trends, gaps, and contradictions in the existing literature, this research contributes a conceptual model that moves beyond the technocentric paradigm and instead advances a representative, context-sensitive, and ethically grounded perspective aligned with the broader goals of the SDGs, particularly SDG 11 [19,28].

Within this context, the paper engages with critiques of smart governance that focus on digital exclusion, privacy violations, and institutional conservatism. Nonetheless, it argues that rethinking governance paradigms in response to digital disruption and ecological crisis is both necessary and urgent. This rethinking raises several guiding questions: (a) What constitutes smart governance in the pursuit of sustainable urban development? (b) What are the key enablers and constraints of its implementation? (c) How can smart governance frameworks be designed to balance technological innovation with ethical, institutional, and social dimensions?

These questions form the foundation for the development of a multidimensional framework that captures the interconnections among governance practices, digital innovation, and sustainability outcomes. In doing so, the framework aims to enrich theoretical discourse and provide practical tools for those working to advance smart governance in complex, rapidly evolving urban environments. The scientific contribution of this study

lies in its integrative approach—bridging theory and practice while clarifying the dual character of smart governance as both a technological and a socio-political phenomenon.

Ultimately, this research underscores the importance of aligning digital transformation with democratic values, sustainability principles, and inclusive policy design. Cities of the future must not only be smarter; they must also be fairer, greener, and more resilient. Smart governance, when carefully and contextually implemented, can provide a powerful pathway to this future by embedding technological innovation within participatory, adaptive, and sustainable governance systems. By highlighting the intricate nexus between governance, technology, and sustainability, this work contributes to the broader effort of reimagining urban governance for the digital age.

2. Literature Review

The concept of smart governance has been the heart and soul of the smart and sustainable city-focused shaping and mobilization of information technology and information-based data, involving citizens in meeting complex urban challenges [2]. Therefore, it is quite important to understand the concept by way of definitions and interpretations of smart governance and its role in smart and sustainable urban environments.

Generally, smart governance may be defined as the use of digital technologies, data-driven decision-making, and participatory approaches to enhance the efficiency, transparency, and responsiveness of government processes and public service delivery [36]. It integrates IoT, big data analytics, AI, and blockchain with governance practices that enhance management of urban resources, infrastructure, and services [16]. However, the literature presents diverse perspectives on the definitions of smart governance and the domains it encompasses within city governance (see Table 1).

Smart governance can be explained in different terms, but basically, it describes the implementation of its use: a technology-centric one, further defined as using advanced technologies to streamline unnecessary administrative processes and improve inter-agency communication to make services smart through infrastructure, digital platforms, and data analytics [2]. A citizen-centric approach engages the residents in decision-making processes by leveraging digital platforms to involve them in policy formation and gathering their responses for co-creative solutions to policies, hence making governance more transparent, inclusive, and responsive [13].

Finally, a data-driven governance approach puts emphasis on collecting, processing, and utilizing data from sources such as sensors and mobile devices to enable evidence-based decision-making, real-time monitoring, and predictive planning for more effective responses to urban challenges [37]. This understanding about smart governance is used as a basis for more literature, discussing its application in smart cities to drive sustainable urban development by enhancing technological innovation, citizen participation, and policy frameworks.

The relationship between smart governance and sustainability has been extensively studied in recent years. Scholars and practitioners have explored how technological innovations and data-driven governance can enhance urban sustainability efforts. Through a review of key studies, this section examines the existing body of literature on smart governance, focusing on its role in promoting sustainable practices and identifying the gaps that still exist in current research.

In the literature, there is an emphasis on the integration of sustainability into smart city frameworks. However, through the importance of corporate governance, digital transformation, and e-participation, it is looked at from the perspective of sustainability in smart governance, urban management, and sustainable development. This would reflect

citizen engagement, such as with e-participation platforms and IoT technologies, in terms of making urban governance more responsive and data-driven [16,38–40].

The implication of the above is that these studies require economic policies and goals to be in harmony with sustainability goals since integration among economic, social, and environmental elements forms a basic principle in the realization of sustainable urban development. Several authors note how it is the integration of economic, social, and environmental elements that is vital to achieving the realization of truly sustainable urban development [15,19,41–43].

The varied exploration of smart city applications shows promise in facilitating the achievement of sustainable development; however, debates on the application's impact on sustainability call for a balanced view incorporating the complexities of the urban context. Frameworks also arise from the "Three Pillars of Sustainability" model, EGOV4SD, among others, that embody the role of technology, legal structures, and governance as anchors that can advance sustainability initiatives. Other conclusions emphasize that reform in traditional governance practices is the most pressing need, with collaborative, digital, and data-driven approaches along with performance evaluation to ensure that smart governance is delivered efficiently [44].

Overall, the literature points to the significance of combining technological innovation, citizen engagement, and integrated policy approaches to achieve sustainable urban development. Smart governance is essential for building sustainable cities, as it integrates technology, data, and community engagement to enhance decision-making and public service efficiency. However, achieving effective smart governance presents challenges, including data privacy concerns, digital inclusivity, and coordination across multiple stakeholders.

2.1. Dimensions and Challenges of Smart Governance

Smart governance is a multidimensional concept that integrates technology, policy, and public participation to effectively manage cities and enhance sustainability. This approach leverages advanced technologies such as IoT and AI to improve the efficiency and transparency of city services while also facilitating evidence-based decision-making [11].

A critical element of smart governance is the establishment of robust policy frameworks that safeguard data privacy and cybersecurity while promoting equitable access to smart solutions. Equally important is the role of public engagement in the governance process, ensuring that citizens are actively involved in decision-making through digital tools and platforms. This comprehensive strategy not only fosters innovation but also strengthens the legitimacy of governance practices, ensuring that urban policies align with the needs of the community.

Smart governance brings together technology, policy frameworks, and public engagement into a critical new dimension of managing sustainable cities. It enables cities to utilize data, digital platforms, and advanced technologies such as IoT, AI, and big data analytics for improved efficiency and transparency in service delivery and evidence-based decision-making, combined with smart infrastructure such as intelligent transport systems [45].

For example, an effective policy framework would guide smart governance in warranting data privacy, cybersecurity, and fairness while encouraging innovation and equity in accessing smart solutions. Public engagement forms an essential part of these processes—engaging citizens in decision-making through digital tools, e-participation platforms, and social media, meaning that policies based on urban settings should be responsive to the needs of the community. This should help ensure better clarity and a great sense of inclusiveness with effective governance, which helps in the overall legitimacy of smart governance practices [2].

To build on the benefits of smart governance, it is essential to acknowledge the challenges and complexities that arise in the practical implementation of these systems, particularly when striving for long-term sustainability. Most importantly, a host of challenges arise in the governance of these cities toward long-term sustainability, including technocentricity [46]: the issues of the overreliance on technology can sometimes overshadow important social, economic, and environmental considerations and possibly negate the human aspects of equity and social inclusion [47].

By way of consequence, decision-making or smart city benefits may exclude marginalized groups. Another challenge is the complexity of governance practices, since many stakeholders, sectors, and interconnected urban issues require coordination and collaboration [48]. This usually makes decision-making cumbersome, as once the existing institutional structures are rigid or fractured, these decisions become difficult to implement.

In addition, the lack of enough money and other assets prevents most cities in developing countries from implementing effective, sustainable governance, compelling them to fall back on unsustainable, short-term cost-cutting strategies. Other challenges consist of conflicting interests and bureaucratic inertia that plague the efforts towards sustainability due to changes in leadership and disruption of the sustainability efforts. With the use of technology, data is more often relied upon by cities, which creates concerns with data security and privacy, thus putting the emphasis on protecting citizen privacy while adding integrity to the data.

Economic growth conflicts with sustainability because cities must attract investments and provide employment opportunities without adversely impacting the health of the environment. For one, inclusivity and equity must be of maximum concern, since such technology-driven development may unwittingly exclude specific vulnerable communities from some or all digital technologies due to their not having easy access or literacy. It is thus incumbent on governance to ensure that the policies and services offered are inclusive, equitable, and accessible to all citizens [49].

2.2. Sustainable Development Goals and Smart Governance

Smart governance plays a pivotal role in achieving the SDGs by leveraging technology, data, and citizen participation to drive urban sustainability. It aligns urban development strategies with SDG objectives, particularly in creating efficient, inclusive, and resilient cities. Smart governance is crucial in aligning urban development with the SDGs by embracing technology, data-driven approaches, and citizen engagement for efficient, inclusive, and sustainable cities.

This, therefore, contributes directly to SDG 11 by harnessing digital technologies that enhance planning, transportation, waste management, and citizen engagement, thereby making cities resilient and sustainable [22]. This will further help the move towards SDG 4 and SDG 3, for instance, in enhancing the accessibility to citizens of quality educational and health services through digital platforms, e-learning, and telemedicine for inclusive access, by also ensuring that the infrastructures and organs in remote areas are up to par.

Under SDG 7, advanced data analytics and clean energy management systems support a smooth shift of cities to renewable energy sources, thereby reducing carbon footprints. The innovation and entrepreneurship developed through smart governance lay a path to developing the economy and promoting job creation under SDG 8. They do so by climate actions such as SDG 13 and sustainable production, which essentially contribute through technologies based on emission monitoring, resource management, and a circular economy. Smart governance increases transparency and accountability in institutions (SDG 16) and builds partnerships (SDG 17) by providing mutual collaboration among

various governments, private sectors, and civil society toward the attainment of sustainable development goals [50].

Important changes in practice, policy, and technology have shaped the formation of urban governance and sustainability through time. Before the 20th century, urban governance was ad hoc, localized, and community-driven, and as such, prime emphasis had been placed on some short-term needs regarding trade, security, and essential infrastructure. This led to a shift of the colonial and industrial periods whereby, within a relatively short period, rapid urbanization was experienced, leading to more formalized governance structures that aimed at economic growth and infrastructure development at whatever cost to the environment and even to living conditions [51].

It was only really within the mid-20th century that environmental awareness started to gain some amount of traction with movements such as Rachel Carson's "Silent Spring" and the launching of Earth Day, which birthed the crusade around the effect of urbanization on the environment. The 1972 UN Stockholm Conference laid down the framework to integrate ecological considerations into urban planning and marked the beginning of sustainability in governance.

Institutionalization of sustainability during the 1980s happened well through the advent of the Brundtland Report and Agenda 21, which called upon cities to change their ways of doing things to promote sustainability [52,53]. The turn of the century ushered in smart technologies for urban governance, with the offering of data- and digital solution-based approaches to efficiency, delivery of services, and citizen engagement.

This period also embraced the SDGs, especially "SDG 11, which aims to make cities and human settlements inclusive, safe, resilient, and sustainable" [54]. Urban governance has since graduated from more top-down, infrastructure-focused planning to greater participation through inclusive and data-driven approaches that see environmental, social, and economic aspects as being compatible with sustainability in urban management [55].

Table 1. Selection of broad smart governance and sustainability definitions and domains sorted by year of publication.

Study	Definition	Domain
Aguilera et al. [38]	A model exploring how corporate governance drives the environmental sustainability initiatives, with a focus on influencing ownership, boards of directors, CEOs, top management teams, and employees in shaping a company's environmental outcomes.	Corporate governance and environmental sustainability
Ahvenniemi et al. [39]	A comparison of sustainable and smart cities through an evaluation of 16 city assessment frameworks, highlighting the stronger focus on technology in smart cities and recommending the inclusion of sustainability considerations in smart city models.	Urban sustainability and smart city frameworks
Akmentina [40]	An exploration of public engagement strategies in urban planning across 12 Baltic cities, shedding light on the enhancement of citizen involvement through e-participation and proposing blended and iterative participatory approaches for effective urban planning.	Urban planning and e-participation
Allam et al. [56]	An examination of emerging trends in smart urban governance using bibliometric analysis, focusing on how smart technologies such as IoT, e-governance, and data analytics contribute to urban governance, while highlighting the importance of citizen participation and inclusivity.	Smart urban governance and ICT
Al-Nasrawi et al. [57]	Posits intelligence as an active process for positive change in the context of cities, leveraging technologies to facilitate innovative solutions aimed at optimizing urbanism in the broad context of sustainable development goals.	Smart sustainable cities

Smart city sustainability
Turnheim et al. [89]	Suggests a conceptual approach for combining systems modeling, socio-technical transition approaches and learning from initiatives when managing the difficulties related to sustainability transition pathways.	Sustainability transitions
Yahia et al. [90]	Discusses smart cities from the governance perspective and more specifically regarding sustainable collaborative networks and provides structures for the enhancement in performance and participation of the stakeholders in smart governance.	Collaborative governance
Yigitcanlar & Kamruzzaman [32]	Argues that the correlation between city smartness and sustainability is not a direct one, noting the need for more efficient integration of smart city initiatives with sustainability objectives. Assesses the impact of smart city policy on urban sustainability using carbon dioxide emissions data from 15 cities within the UK.	Urban sustainability
Zachary & Jared [91]	Characterizes e-governance levels and the use of ICT in enhancing participation, transparency, and accountability, emphasizing how e-governance improves service delivery, access to information, and citizen engagement.	E-governance
Zhu et al. [92]	Develops a typology for smart cities in China, categorizing them into five types: knowledge-technocratic, holistic, green, equipment-technocratic, and emerging smart cities, based on characteristics such as input, throughput, and output of smart city practices.	Smart city typology

3. Research Design

This research uses a systematic literature review to explore the intersection of smart governance and sustainable cities. The review protocol follows the established guidelines proposed by Kitchenham and Charters [93] and aligns with the PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) standards to ensure rigor and transparency [94]. The systematic review was conducted using several comprehensive academic databases: Google Scholar, Scopus, Web of Science, and JSTOR, as they are the most recognized data-based sources of information. These databases were chosen for their broad and comprehensive indexing of journals of high academic and scholarly standard that are peer-reviewed and come under the categories of subject specializations such as urban planning, environment, government, and technology.

Only keywords and simple Boolean operators were employed in the search to obtain as many relevant works as possible. The keywords included (“smart governance” OR “e-governance” OR “urban governance” OR “city governance” OR “e-participation” OR “collaborative e-governance” OR “governance e-collaboration”) AND (“smart city” OR “smart cities” OR “sustainable cities” OR “urban sustainability” OR “sustainable city” OR “citizen sustainability”). The selected keywords were intended to capture a broad range of studies addressing the intersection of smart governance and sustainability, including both theoretical explorations and “practical” implementation cases, ensuring comprehensive and relevant search results.

The review included peer-reviewed journal articles published in English that focused exclusively on the concept of smart governance and its role in advancing sustainable cities. To ensure relevance, only studies published from 2000 onwards were considered, as the increasing adoption of information technology in governance has significantly amplified the importance of smart governance in recent years.

The selected articles (including original articles, reviews, conference papers, and book chapters) presented empirical findings, theoretical models, or case studies that examined the impacts and implications of smart governance implementations, providing a comprehensive understanding of its contributions to urban sustainability. Review papers were included to capture synthesized insights and identify overarching trends and research gaps not always visible in individual studies. Their inclusion supports a more comprehensive understanding of smart governance and sustainability in urban contexts.

To ensure the quality and credibility of the findings, this systematic review excluded sources that were not subject to peer review, such as conference abstracts, technical reports, and grey literature. Furthermore, literature that did not explicitly address both smart governance and sustainability was excluded, as it may not have directly contributed to the research objectives. Similarly, technological studies that lacked a governance or sustainability perspective were omitted to maintain the study’s focus on the intersection of smart governance and urban sustainability.

Article Selection Process

This involved a systematic procedure of article selection, and the following stages were used in the process of selecting articles for review: the first level of reducing the articles was conducted by scanning their titles and abstracts to determine their relevance to the research. It was at this point that any article that any one of the researchers noted was clearly outside the inclusion criteria was removed. This process was useful to filter too-general papers and focus only on the papers that addressed the topic of smart governance for the sustainable development of cities. In the last phase, a publication review was carried out wherein the full text of the remaining articles was sourced and individually reviewed.

This entailed evaluating the significance of each of the articles and the methods used for answering the research aim and the wider usefulness of the research. Papers were screened according to study type and methodology, as well as sources of data and analytical techniques, to include only high-quality research studies. These articles were selected, and then only those articles that had survived in the full-text reviews were chosen, and records were kept as to why the specific studies were eliminated at this stage. This resulted in the selection of the final 50 articles.

Lastly, these 50 articles were re-read, reviewed, categorized, and analyzed using thematic analysis. This literature selection procedure is illustrated in Figure 1. To maintain transparency and reproducibility, two reviewers independently screened and selected the studies. Any differences in selection were addressed through mutual discussion,

and when consensus could not be reached, a third reviewer provided input to resolve the disagreement.

Figure 1. PRISMA flow diagram: literature selection procedure for the systematic review.

To maintain the high quality of the extracted information, a standard data extraction form was developed. The identification information comprised only the study ID with the author and the year for simple bibliographic information needed when citing the studies. The geographic focus was used to locate or pinpoint the place or area where the study took place, so that if there were variations, it would be easier to notice them or point them out.

In addition, data on the governance frameworks and practices concerned the models, strategies, or frameworks of smart governance examined in each of the studies. The outcomes related to urban sustainability were recorded so that an understanding could be gained of smart governance's effects on urban sustainability, especially in the environmental, social, and economic spheres. Moreover, if there were any challenges and barriers identified in a step or process of implementing smart governance, then they were recorded to recognize the factors that may require further research or enhancement.

The reviewed studies employed various methodological approaches, including qualitative analysis, thematic analysis, narrative synthesis, and descriptive statistics. In presenting

our findings, we categorized and summarized these studies based on the methods used. For example, many studies applied thematic analysis to organize related trends and themes in smart governance and sustainability. Others employed narrative synthesis to interpret and link diverse findings, while some used descriptive statistics to report on the frequency and distribution of smart governance practices. Our analysis reflects these patterns by grouping studies according to these methodological orientations to provide a structured overview of the research landscape. As a result, these methodological approaches made it easier to identify the level of occurrence of specific themes or practices in the smart governance of sustainable cities.

While the systematic review offers a comprehensive overview of smart governance in sustainable cities, several limitations must be acknowledged. First, the review may be affected by publication bias since the study includes only published, peer-reviewed articles, potentially excluding relevant findings available in grey literature or unpublished studies. Moreover, there is a risk of language bias, as only English-language articles were included, thus possibly overlooking important research published in other languages. Finally, the exclusion of grey literature could mean the review misses practical insights and case studies from reports, policy documents, and other non-academic sources that may offer valuable real-world perspectives on smart governance.

4. Analysis and Results

4.1. General Observations

The descriptive analysis included 50 selected pieces of literature, broadly classified based on the geographical distribution, types of studies, and year of publication, giving an insightful overview of the research landscape on sustainable cities and smart governance (Table 2). The reviewed studies primarily came from developed regions such as Europe, but the principles outlined can be applied globally. Regarding geographic distribution, it is evident that 34% of the studies are from Europe, reflecting the region's leadership in advancing sustainable cities with robust governance frameworks. Global studies account for 36%, clearly demonstrating the widespread interest in integrating governance with sustainability across various urban contexts. Other regions—including Asia (20%), Africa (4%), South America (4%), and the Middle East (2%)—show a steady yet significant uptake of smart governance principles in the context of sustainable development (Figure 2).

Figure 2. Geographic distribution of studies on smart governance for sustainable cities.

Regarding the types of studies, the methodology categorized the research studies on governance in sustainable cities. Literature reviews covered 44%, indicating a significant extent of synthesis in the assimilation of the existing literature. Case studies and theoretical studies each occupied 40%, offering empirical and theoretical input into the governance system in urban studies. Experimental studies covered 6%, while observational studies and viewpoints contributed 8% and 2%, respectively, to the assemblage of opinions on governance in various urban contexts (Figure 3). Based on Figure 4, interest in smart governance and sustainable cities began to rise significantly after 2015, with the number of studies peaking in 2017. Although there has been a slight decline in recent years, the overall trend remains upward, reflecting the growing recognition of governance as a key driver in supporting urban sustainability goals.

Figure 3. Distribution of study types in research on smart governance for sustainable cities.

Figure 4. Number of studies published per year on smart governance for sustainable cities.

After the review of the selected 50 papers on smart governance in sustainable cities, they were classified into four groups based on insights. The selected literature was clustered into the following themes:

- Smart governance frameworks in practice: This theme focuses on the integration of advanced technologies such as AI, IoT, and blockchain into governance models and includes 14 papers.
- Governance challenges and barriers: This theme addresses issues such as the digital divide, access for marginalized populations, and privacy concerns in technology-centered models, encompassing 12 papers.
- Case studies of successful smart governance: This theme covers instances where grassroots participation has led to positive governance outcomes (includes 13 papers).
- Technocentric vs. human-centric governance approaches: This theme compares technology-driven methods with those emphasizing grassroots participation. It includes 11 papers.
- Towards a multidimensional framework: This theme integrates insights from all 50 papers, aiming to create a comprehensive approach that balances technological, social, and governance aspects.

It is worth noting that while the research reports were classified under these first-order categories, many of them overlap. The results of our analysis are discussed in detail under the five categories in the following section, with limitations and opportunities highlighted in Table A1 (Appendix A).

4.2. Smart Governance Frameworks in Practice

Smart governance frameworks are instrumental in ensuring that cities exploit technology in an appropriate manner and at the same time explore efficiency, sustainability, and citizen involvement. Indeed, a few cities around the world have adopted governance styles that have a blend of both the technocentric and human-centric approaches. Some examples of governance frameworks that have been adopted in cities with successful integration of sustainable practices are as follows:

Singapore's Smart Nation Initiative is perhaps one of the most advanced implementations of technocentric governance. This model primarily relies on a high-intensity use of IoT, big data analytics, and AI in enhancing public service delivery, smart infrastructure configuration in cities, and sustainability. The initiatives have improved the efficiency of public services while reducing carbon emissions through smart energy grids, traffic management systems, and predictive analytics for healthcare. Furthermore, the system includes blockchain to ensure security and transparency in its transactions. In this way, it makes governance more responsible and efficient. Nonetheless, the problem is that these technologies have, in turn, to be accessible lest certain segments of the population fall through the cracks because of the digital divide [95].

Barcelona proves to be at the forefront of human-centered governance with its Decidim platform, opening its governance processes for direct participation by citizens. The Decidim is a participative democracy open-source platform where residents can contribute to urban planning, propose laws, and vote on local projects. Governance is still quite transparent and participative, thus ensuring a high level of civic engagement for Barcelona. Technologies in the form of smart city solutions, including sensors for monitoring pollution levels and managing traffic flows, complement the Decidim platform to meet challenges in pursuing urban sustainability. By harnessing the confluence of technology and citizen engagement, Barcelona has been able to reduce pollution and improve mobility within the city [96].

The city of Medellín in Colombia is a prime example of the possibilities in governance, with the focus being on social inclusion and sustainability, as perhaps seen in the "City

for Life” strategy. The days when this city was synonymous with crime are now behind it. Through social cohesion, grassroots participation, and innovation in urban policies, it has achieved a significant transformation in its model of governance. A network of public consultation tools was used whereby the city involved the citizens in the decision-making process, developing sustainable urban spaces such as “Green Corridors”, as they have the potential to decrease heat islands, so increasing biodiversity. The strategy of public participation and inclusiveness ensures that every one of the city’s residents can have a say in the future of the city [97]. Medellín’s success represents the human-centered governance that leads to sustainable urban development and enhances the level of social resilience [97].

Collaborative governance has been applied in Aarhus in Denmark by adopting a collaboration with smart sensors, IoT, and green energy systems towards a general aim of achieving carbon neutrality by 2025. The platform, known as City Data Exchange, adopted by the city, offers public and private stakeholders a chance to access and share data to optimize urban planning, energy usage, and public transport [98]. Citizens will thus be involved via the aggregated platforms designed to offer them dimensions on which they can contribute towards the sustenance of the green city. The governance system of Aarhus highlights the use of data not only as an efficient input towards making improvements within the city but also as a tool to ensure inclusivity through citizen engagement in green issues, such as minimizing car use and promoting cycling [98].

Among the world’s most advanced e-government systems, Tallinn, Estonia, is distinctive for its emphasis on digital participation and transparency [99–101]. Citizens in Tallinn now log into public services, e-vote, and engage in governance through digitally available portals such as Osale.ee, using technologies such as blockchain and digital ID, thus creating frictionless interaction between the government and citizens, improving transparency, and garnering more public trust. Furthermore, Tallinn adopts smart technologies, including energy-efficient infrastructure and digital sensors, to improve sustainability in running the affairs of the city [99].

Amsterdam’s Smart City Framework assimilates technology with a robust citizen-centric approach. The city makes maximum use of its public services and infrastructure, which incorporates the smart grids of energy and sustainable waste management through the implementation of IoT and urban dashboards. Amsterdam is different because it involves citizens in urban development projects by organizing public consultations and digital feedback systems, among others. For instance, one can submit ideas on urban projects that are aimed at achieving sustainability goals and can even vote for them. It strikes a balance between the technocentric and human-centric aspects of governance, where technology no longer helps only in operational efficiency but also meets the needs of the public [25,102].

4.3. Challenges and Barriers to Smart Governance

This systematic review shows a comprehensive perspective of the complexities involved in smart city initiatives. This encompasses the urban governance and sustainability frameworks leading to such initiatives. After all, there is great scope for technological change for improvement in urban areas, but its success depends on surmounting socio-political hurdles and achieving standardized metrics, which requires greater participation from all stakeholders (Appendix A Table A1). Different studies explain how governance strengthens the motivation for sustainability; however, the disparity in metrics used to measure corporate sustainability diminishes action. This is most evident when discussing corporate governance and how these impacts on sustainability, for which measurable metrics are not available [38].

One of the greatest challenges so far has been the lack of standardized frameworks that would allow effective comparison of initiatives involving smart cities [39]. Another important issue is e-participation in urban planning, especially in the case of Baltic cities: Technology is increasingly integrated into governance, but digital illiteracy and political resistance limit its full potential [40]. The idea of developing Fog-of-Things (FoT) to facilitate smart governance is discussed, but this research indicates that such technology brings many obstacles and resistance from the old system to allowing it on a large scale [87].

Deployments of smart city applications can contribute to improving sustainable urban development, but the current main obstacles, involving massive investments and a shortage of labor at this stage, often hinder their deployment [59]. The digitization of tools for citizen participation in local governance does not enhance engagement, primarily because exclusionary barriers to socio-economic inequality exist [1,58]. Moreover, the prime characteristic of dominant high-level strategic policy frameworks of smart cities is that the integration of heterogeneous technologies and governance models puts severe constraints on them [60].

To analyze city sustainability, one research proposal establishes a taxonomy using ICT tools, but the quality of data and its collection conditions differ considerably for each city, which is of major concern [41,96]. Another route to envisioning the future of smart sustainable cities applies a backcasting approach, which faces challenges in aligning long-term policy goals with the immediate needs of urban governance [42,60]. The work also points to challenges in governing global change, specifically the convergence of international and national governance systems [15,103]. Sustainability frameworks and models of governance are essential for providing a solid governance structure to navigate urban management complexities, though stakeholders often resist this balance [19,33,104]. Indeed, there are questions as to whether smart city models contribute to sustainability or just create unbearable complexity through the numerous economic and social issues involved [43,60,95]. Reviews of historical aspects regarding concepts of urban sustainability reveal that most of these concepts are abstract and hard to apply in practical situations [63,64,67]. Another challenge identified in the paradigms of urban public governance is a balance between the scale of technological development and governance structures [26,65,66,68].

Smart governance in cities involves addressing various dimensions, with challenges often arising from the lack of standardized metrics to assess sustainability, complicating the evaluation of such projects [69,70]. Scholars suggested that the idea of a smart city is often vague and corporate rhetoric rather than concern for public welfare, which brings into question the sustainability of smart governance practices [71]. With respect to legal frameworks for smart city initiatives, they do indeed appear to lag far behind the rapid pace of technological innovation in countries such as China and Indonesia, with this lag deterring effective governance models [72,73].

The effort to advance the framework of a smart, sustainable city often results in traditional governance structures being slow to adapt to the latest technological innovations [74,75]. Public participation is an integral feature of smart governance, but the fact that most of its related initiatives are corporate-driven invites criticism, and most studies have pointed towards a balanced and more inclusive approach [76,79,105]. Smart governance will thus be considered only if there exists a metagovernance system in place to achieve the SDGs wherein inclusiveness and increased citizen participation become unavoidable [77,78].

A metagovernance framework for sustainable development lacks concrete application in the urban environment [80]. Concerns over transparency and political intrusion make Andhra Pradesh's smart governance initiatives dubious [29]. The aspirations of Indonesian smart governance for practical improvement in delivering public services fall

through a gap. The issues regarding the standardization of the concept of “smartness” prevail even in the purported multidimensional model of smart cities [3]. Community participation was found to enhance e-governance in Africa but was hindered by limited technological infrastructure [57,81]. E-participation has potential but faces challenges in engaging marginalized communities. Adoption of e-governance varies across Europe, limiting overall progress [82,83].

Sustainability transitions require clearer frameworks for real-world policies, and integration of technology in governance in the UAE remains limited [84,85]. Balancing technological advancement with citizen participation is challenging in social emergence models and IoT-enabled governance [86,87]. Inconsistencies in smart city definitions were identified, and a comprehensive sustainability model was proposed but found to be overly complex [88,89].

Several challenges have been identified in the existing literature regarding the implementation of smart city initiatives and urban governance: Collaborative informatics networks lacked clear real-world implementation strategies, and translating smart city policies into tangible improvements remains a problem [32,90]. The importance of accessible ICT for enhancing e-governance has been emphasized, while a comprehensive understanding of smart cities in China requires broader comparisons with global contexts [91,92].

Current themes in urban governance highlight the complexity of policies and institutional structures involved in implementation [63]. Studies also stress the urgency of implementing smart urban governance, pointing to the difficulty of integrating technology with governance mechanisms while maintaining strong citizen engagement [76]. Another key issue is the classification of smart cities in China, which reflects regional diversity and underscores the importance of global comparative frameworks. Additionally, research has explored the connection between population decline and urban transformation in older New Towns, calling for policy responses to address aging demographics and land-use challenges [77]. Overall, these studies suggest that smart governance demands not only technological solutions but also comprehensive policies that foster inclusivity, adaptability, and active public engagement.

4.4. Smart Governance Best Practices

Several smart governance models across cities worldwide illustrate how technology has been deployed to promote sustainability and enhance citizen participation in decision-making, a point that is also discussed in this systematic review (Appendix A Table A2). The city of Johannesburg uses a digital platform and GIS technology for urban governance to minimize the ills of fragmentation in the city and ensure sustainable development. The city is focused on grassroots participation through local councils, such as Baraza and Indaba, which helps to create community involvement and support for sustainability goals [106].

Singapore’s Smart Nation Initiative aims to use all the latest technologies available today, such as AI, IoT, and blockchain, to better optimize urban mobility as well as the delivery of public services. Making urban planning sustainable, easing congestion, and increasing the delivery of services are key operational strategies in Singapore. Public interaction is facilitated through digital interfaces that enable their interaction with government initiative programs and give them real-time feedback [95].

Another city of importance that has embraced the smart city model is Tallinn, Estonia, using a single smart city model. The city has enhanced public service delivery using e-government platforms and AI technologies and has employed citizen participation through portals [100,101,107]. The combination of ICT and AI has transformed the governance system in Kenya, effectively improving public participation and decision-making. Since digital services have made governance more accessible and transparent, it has enabled a fair

distribution of resources among marginalized communities. Kenya's governance model emphasizes harnessing these technologies to empower citizens via grassroots participation, reinforcing their role in shaping policy [81,108].

The smart city initiative in Leuven city, Belgium, entails business process enhancement and simplification of public services via digital platforms and AI. E-participation platforms promote active engagement with the opportunity for citizens to interact with government officials and participate in decisions regarding urban planning [31].

With e-government initiatives, Estonia has really experienced a huge leap in participatory governance, especially in the use of digital platforms and blockchain technology. High levels of digital participation support Estonia's transparent public-service delivery system while citizens engage in governance through digital platforms and e-services [101,107].

The governance model of Istanbul, Turkey, encourages the knowledge-based development of the urban entity through digital platforms, AI, and urban analytics. This model goes beyond economic competitiveness and guarantees sustainable economic growth. Public participation increases through the encouragement of active participation of city dwellers in the development process of the city by availing of digital platforms [27].

Each of these cities illustrates how advanced technologies, powered by advanced smart governance frameworks, can drive sustainability in a productive manner while engaging citizens meaningfully with them. This allows the diversity of governance models—from centralized, technology-driven approaches like Singapore to community-based strategies like Medellín—to demonstrate the adaptability of smart governance in different cultural and socio-economic contexts [104].

NEOM is the proposed future city of Saudi Arabia, one of the most important smart governance projects in the Middle East, which aims to integrate all the advanced technologies regarding AI, renewable energy, and digital infrastructure into a sustainable environment. Probably one of the most significant aspects of the governance model in NEOM is that it shall be data-driven, improving public services, resource management, and transport networks using IoT sensors and AI-based systems [109]. Transparency, citizen engagement, and streamlined administrative processes are also characteristic features of NEOM's smart governance, as these make the government structure more responsive and adaptive.

The technology for monitoring water usage, traffic flow, and energy consumption demonstrated the possibility of using data in real time to assist NEOM in making timely, informed decisions aimed at effective, efficient service delivery alongside environmental sustainability [110]. Public participation is also envisaged to be part of the smart governance framework, with citizens participating through digital platforms by providing feedback toward shaping policies. These considerations and the use of the latest technologies make NEOM one of the unique case studies in successful smart governance in the Middle East, which demonstrates the potential use of digital transformation to encourage sustainable, efficient, and citizen-centric approaches to urban management [1].

4.5. Technocentric and Human-Centric Governance Models

In the rapidly evolving landscape of urban governance, two distinct approaches have emerged: The former uses a high degree of advanced technologies, such as AI, IoT, and data analytics, to optimize and streamline city operations and decision-making processes. The latter calls for active citizenship, inclusivity, and deliberative democracy through citizen-inclusive means, whereby technological innovations serve the needs of citizens rather than driving governance independently [95]. The technocentric governance model focuses on exploiting advanced technologies in improving urban infrastructure and service delivery. Cities embracing this model, such as Singapore, rely on real-time data, AI algorithms, and

IoT devices to enable optimal decision-making, which is sometimes entirely automated to boost efficiency [111].

Singapore's Smart Nation initiative has brought about a revolution in the management of cities since it started the monitoring of traffic, energy consumption, and waste management in real time, thus enlivening the situation in terms of minimizing inefficiencies and optimizing resources. In Singapore, the use of IoT sensors reduced traffic congestion and optimized public means of transport. This, however, invites the criticism of over-reliance on data, as it easily tends to overlook the human element, especially alienating communities with significantly less access to more sophisticated digital technologies or those with reduced digital literacy [95,104]. Technocentric governance makes it easy to process large data sets so that various urban challenges can be solved hastily. Globally, although smart city technologies have enhanced public safety by means of facial recognition and AI-related integrations, concerns about privacy and reduced human oversight of governance processes have evolved [14].

In contrast, human-centered governance places people at the center and the focus of decision-making processes while using technology to facilitate inclusive governance. Cities such as Barcelona and Medellín developed participative platforms through which citizens can directly intervene in policies related to the city. For instance, the Decidim application in Barcelona enables inhabitants to be involved in city planning, to vote on significant initiatives, and to come up with ideas for solutions to problems that citizens face in their locality, so ensuring transparency is retained and it is people-centered governance [96,97].

The level of inclusion and citizen participation based on human-centered governance enhances citizen participation and ensures that the decisions are made based on the needs and wants of the public. Through the "City for Life" strategy in Medellín, the citizens are involved in the urban transformation process to create social cohesion and decrease crime due to the connection with governmental strategy through public input [97]. It is slower and more resource-intensive because the decisions require constant consultations and feedback from the public, which can hinder the implementation of critical policies or projects.

In such a future city, it should never be solely either technocentric or human-centric; there needs to be an optimal balance between the two. Technology can uplift urban management more meaningfully, but if one goes by data-driven approaches per se, then the citizens will start to feel alienated and nuances in community needs will go unaccounted for. The hybrid model would be helpful here, as, for example, in Helsinki, where AI-driven services are supported by public feedback mechanisms. In the citizen-centric smart city of Helsinki, technology is used to enhance the delivery of services while ensuring that citizens remain involved in the shaping of urban development, thus integrating efficiency with inclusiveness [112,113] (Appendix A Table A3).

4.6. Towards a Multidimensional Framework

In developing the theoretical framework for smart governance, a review of 50 papers identified five thematic categories in smart governance, each contributing distinct perspectives to the field. The first category, analytical and comparative frameworks, encompasses 10 studies focused on examining and contrasting various governance models. Next, conceptual and development-oriented frameworks includes nine studies dedicated to building foundational theories and models for smart governance. The third category, e-participation and citizen-centric governance frameworks, also with 10 papers, highlights an approach that prioritizes citizen involvement in governance. Governance and policy frameworks is represented by 11 papers discussing policy design and implementation strategies within governance systems. Lastly, smart cities and sustainability frameworks comprises 10 papers

exploring how smart technologies can be integrated to promote sustainable urban development (see Appendix A Table A4).

An analysis of current smart governance frameworks suggests that the concept is still underdeveloped, though recent efforts such as those of Alajmi et al. [1] indicate promising directions. Nonetheless, these frameworks often face limitations, either due to insufficient theoretical depth or a lack of broader adoption and recognition. Consequently, there is an opportunity to advance and refine smart governance frameworks further. Conceptually, to establish a comprehensive and actionable understanding for designing smart governance that supports sustainable and balanced growth, this study introduces a “system of systems” framework [2]. This framework integrates core drivers of smart governance with intended outcomes. As shown in Figure 1, the proposed model builds upon essential characteristics identified in the existing literature, as outlined in greater detail below.

Smart governance has increasingly aligned with sustainability goals as cities worldwide work to balance urban growth with environmental and social needs. The sustainable governance framework conceptualizes smart governance as an integrated and balanced system aimed at achieving sustainable urban development. Using the input–process–output–impact (IPOI) model, the framework structures its components into interrelated layers, beginning with the governance itself as the primary input or asset. Four core components—policy, technology, community engagement, and innovation—drive the process layer, collectively enhancing governance capabilities. The “desired outcomes” (accountability, resource efficiency, transparency, citizen engagement, climate change mitigation, biodiversity conservation) constitute the “output”.

The policy component establishes a regulatory environment that sets standards for digital infrastructure, data privacy, and environmental protection, guiding sustainable governance [20]. Technology serves as the operational backbone, utilizing tools such as AI, IoT, and smart devices to collect, analyze, and manage data, enabling informed decision-making and proactive resource management [114]. Community engagement fosters inclusivity, involving citizens actively in the policy-making process through public participation platforms and civic engagement tools, ensuring that governance outcomes align with public needs and values. Innovation drives continuous improvement, encouraging research and development initiatives to explore sustainable solutions to urban challenges, such as green technologies and advanced waste management [115].

The IPOI model’s approach demonstrates a transformation in governance systems, where “input” (initial governance elements) gradually develops into a smart governance system, driven by specific “outputs”. This model suggests a quadruple bottom-line perspective, emphasizing four central development pillars: economy, infrastructure, environment, and governance, represented in the framework’s outermost layer [116]. The intended results—or outputs—of a smart governance project are organized within the outer middle layer, encompassing key goals such as “citizen engagement”, “resource efficiency”, “transparency”, “accountability”, “climate change mitigation”, and “biodiversity conservation”. The inner middle layer includes core drivers of smart governance, such as “community”, “technology”, “policy”, and “innovation”, which propel the process. Positioned at the innermost level is the essential asset: “smart governance” [117] (Figure 5).

This framework follows a structured cause-and-effect rationale, where sustainable smart governance emerges from a sequence of interconnected elements. Starting from governance resources, the model moves through a systematic set of steps, each contributing towards achieving ultimate objectives and sustainable outcomes. This sequence is divided into distinct sections, enabling a clear mapping of each driver’s impact on governance outcomes. Key enablers such as technological advancements and policy changes play

pivotal roles in enhancing governance effectiveness, for example, through expanded access to economic and social participation enabled by digital solutions.

Figure 5. Multidimensional framework of smart governance for sustainable cities.

Distinct from many other smart governance approaches, the framework emphasizes smart “policy” as the essential ingredient and primary driver of smart governance development, with policy inputs creating a regulatory and legislative environment that enables smart governance by establishing standards in digital infrastructure, data privacy, and environmental regulations. These policies clearly establish guidelines for the management of resources so that governance practices will meet sustainability objectives and high

standards of accountability. Hence, policy inputs provide a stable foundation for governance actions to be built upon, allowing consistency in dealing with the multidimensional demands of sustainable urban management [20].

The proposed framework will be supported by technology as a second driver, which will provide an operational backbone to collect, analyze, and disseminate data for sound decision-making. Future technologies such as AI, Internet of Things, and big data analytics can monitor the functionality of cities in real time with respect to consumption levels of resources, environmental effects, and citizen interaction rates. It makes the use of technology in governance enhance operational precision to enable city administrators to anticipate or even proactively respond to upcoming challenges such as infrastructure maintenance, energy management, and environmental monitoring. The system also supports data-driven decision-making that improves efficiency in using resources, reducing waste, and supporting the sustainability of systems [114].

The third essential driver is community involvement, or civic engagement, in the policy-making process. It fosters an inclusive approach through public participation that matters in the determination process using civic engagement and participation instruments. Social cohesiveness and trust can be built through active communities participating in decision-making due to their role as equal contributors rather than as mere receivers of an urban environment. This engagement is important for sustainable governance because it aligns the governance outcome with the needs and values of the population. Not only does this improve the legitimacy of governance action through community drivers, but it also ensures that policies and initiatives reflect local priorities.

The framework thus makes up a responsive and adaptive system of governance that evolves together with its citizens. The innovation driver is the dynamic part of this framework, which means it stimulates continuous improvement through research and development and creative problem-solving. In sustainable city governance, innovation calls for examining new solutions to urban issues, be it something like green technology adoption or creative waste management practices that may be developed in innovative smart infrastructure. Providing an experimental and cross-sector supporting environment, the framework facilitates cities in reacting to dynamic conditions and fulfilling sustainable urban development requirements in the right manner. The framework is thus essentially an innovative one, because it is innovation that will provide the agility, resilience, and forward-looking aspects to the governance structures [115].

In addition to these drivers—community, technology, policy, and innovation—the framework's comprehensive conceptual view focuses on achieving desired outcomes within development domains, such as resource efficiency, transparency, citizen engagement, accountability, climate change mitigation, and biodiversity conservation, which play a critical role in determining the performance of smart governance. Through these interconnected layers, the framework promotes resilient, inclusive, and adaptable urban governance, aligning with long-term sustainability goals across social, environmental, and economic dimensions [118,119].

5. Findings and Discussion

This systematic literature review examines the role of smart governance in advancing sustainable cities, identifying key insights, prevailing trends, and areas where findings align with, extend, or diverge from established research. The review underscores the concept that smart governance is inherently multidimensional, offering potential benefits for sustainable urban development through the integration of digital technologies, participatory governance, policy innovation, and institutional collaboration. Nevertheless, it

also reveals significant challenges that limit the universal applicability and adaptability of smart governance models, particularly in diverse socio-political and economic contexts.

A central finding is the strong emphasis in the literature on technologically enabled governance frameworks. Approximately 34% of the studies reviewed are focused on European cities, reflecting a regional leadership in smart technology integration—particularly the use of IoT, AI, and blockchain technologies—to improve public service delivery, urban planning, and citizen engagement. These findings are consistent with the conclusions of Ahvenniemi et al. [39], who argue that European cities are often better positioned to implement smart governance models due to their advanced digital infrastructure and supportive regulatory environments, which facilitate experimentation and innovation in governance practices.

Similarly, parallel studies on global cities highlight the importance of innovation-oriented institutional cultures and infrastructure investments, reinforcing the notion that technologically mature regions are more conducive to adopting smart governance frameworks. Nonetheless, these trends are challenged by observations from Castelnovo et al. [43], who caution that technology-centric models may inadvertently exacerbate social inequalities by marginalizing vulnerable populations with limited access to digital infrastructure. This contradiction highlights a broader tension in the literature: while technology is a powerful enabler, it can also deepen existing divides when not embedded in inclusive governance frameworks.

Community engagement emerges as a critical dimension of smart governance across the literature. This aligns with the arguments of Patterson et al. [84], who emphasize the importance of citizen-centric governance for achieving sustainable cities. Barcelona's Decidim platform exemplifies this approach, enabling residents to directly participate in city planning and policy formulation through a transparent and inclusive digital interface. Likewise, Medellín's "City for Life" initiative demonstrates the value of bottom-up engagement in building social resilience, improving safety, and fostering a sense of civic ownership. These human-centric models reinforce the arguments of Rochet and Belemlih [86], who assert that involving community representatives in decision-making processes strengthens social cohesion and cultivates trust in governance institutions.

This perspective reinforces the notion that community-oriented governance has the potential to bridge socio-political divisions and foster more inclusive urban futures. However, despite the rhetorical prominence of citizen participation in the literature, its practical implementation remains fraught with challenges, particularly in regions where digital access is uneven. The critiques offered by Alonso [58] and Akmentina [40] are instructive here, warning that e-participation initiatives may unintentionally exclude marginalized groups without adequate provisions for equitable access and digital literacy. These critiques highlight a persistent dilemma in smart governance discourse: Technological platforms designed to enhance participation may paradoxically entrench social exclusion if underlying inequalities are not addressed.

The review also categorizes governance models into two broad approaches: technocentric and human-centric. For instance, Singapore represents a technocentric model characterized by the extensive use of AI and IoT to drive operational efficiency, automate decision-making, and optimize resource use. In contrast, cities like Barcelona and Medellín reflect a human-centric orientation, prioritizing participatory processes and social inclusion. This duality echoes the analysis of Bowen et al. [19], who articulate the trade-offs between efficiency-focused, data-driven models and more inclusive, community-oriented governance strategies.

While Singapore's model exemplifies high-performance in-service delivery, it also faces criticism for limited citizen inclusivity, particularly among those without sufficient

digital access or literacy. Rochet and Belemlih [86] argue that purely technical solutions often fail to accommodate the complex, diverse needs of local populations, making them less effective in contexts where inclusiveness is a priority. Cities such as Amsterdam have begun to adopt hybrid models that combine the strengths of both approaches, integrating technological innovation with participatory governance mechanisms. These developments reflect growing scholarly support for governance models that are context-sensitive, flexible, and capable of accommodating both efficiency and equity.

A key trend identified in the literature is the growing emphasis on multidimensional frameworks of governance. These models seek to holistically integrate policy, technology, community engagement, and innovation to address the complexities of urban sustainability. Scholars such as Benites and Simoes [41] and Meuleman and Niestroy [80] advocate for governance frameworks that can navigate the intertwined challenges of urban functionality, stakeholder diversity, and environmental resilience. The multidimensional approach provides a useful lens through which to understand smart governance as more than just the application of digital tools but rather as a systemic reconfiguration of urban governance practices.

Despite its promise, one of the most significant challenges facing smart governance is the absence of standardized metrics for evaluating sustainability impacts. This concern is echoed by Ahvenniemi et al. [39] and Grossi and Welinder [68], who highlight how inconsistent evaluation standards hinder efforts to compare governance models or scale successful practices across different urban contexts. Without robust shared indicators, it is difficult for policymakers to assess whether smart governance initiatives are truly advancing sustainability objectives or simply reproducing existing inequalities under a digital veneer.

Another key finding of this review is the critical importance of context-specific adaptability. While smart governance frameworks can significantly enhance urban sustainability, their effectiveness is highly dependent on local conditions. Cities with advanced digital infrastructure and favorable institutional environments—typically in Europe—are more likely to implement successful smart governance models. Conversely, cities in the global South, or those with weaker digital and institutional capacities, may struggle to realize the same benefits, raising questions about the scalability and transferability of these models. This concern reinforces the need for policymakers to adopt contextually tailored governance strategies that align with local needs, capacities, and constraints rather than applying one-size-fits-all solutions.

The findings also suggest that integrating technocentric and community-centric approaches through hybrid models may offer a path forward. While digital technologies enhance efficiency and responsiveness, sustainable urban governance ultimately requires active citizen involvement, trust-building, and social inclusion. Amsterdam's governance strategy serves as a compelling example of how technological and participatory elements can be synergistically combined to create inclusive and future-proof urban systems. These models demonstrate that smart governance does not have to be technologically deterministic—it can and should be shaped by social values, participatory processes, and institutional accountability.

This review further highlights governance innovation as a critical factor in shaping sustainable urban futures. As cities continue to evolve in response to digital transformation and global sustainability challenges, governance systems must remain flexible, inclusive, and responsive. Nonetheless, the absence of consistent evaluation tools remains a substantial barrier to effective implementation. The development of comprehensive assessment frameworks that account for the multidimensionality of smart governance is urgently needed. Such frameworks would allow decision-makers to measure impacts more

effectively, identify areas for improvement, and ensure that governance innovations are aligned with broader sustainability objectives.

Furthermore, this review reinforces the view that smart governance represents a pivotal mechanism for advancing urban sustainability—but only when it is implemented in ways that are socially inclusive, contextually relevant, and ethically grounded. Bridging the gap between technology, policy, and community engagement is essential for realizing the full potential of smart governance. The evidence suggests that neither technology nor participation alone is sufficient; rather, their integration within adaptable, multidimensional frameworks holds the greatest promise for addressing the complex and evolving challenges of urban governance.

The effectiveness of smart governance strategies is also highly contingent upon cultural, economic, and institutional contexts. As Caprotti et al. [120] emphasize, urban governance models cannot be universally applied without considering local variations in political structures, resource capacities, and civic engagement norms. Recognizing these differences is essential to avoid one-size-fits-all solutions and to ensure that smart governance frameworks are adapted to the specific challenges and opportunities of diverse urban settings. Incorporating such context-aware perspectives enhances both the conceptual depth and the practical relevance of governance innovation.

In summary, this study offers a critical synthesis of the literature on smart governance, revealing both the potential and limitations of current approaches. It calls for greater attention to contextual factors, the development of robust evaluation metrics, and the adoption of hybrid models that balance digital efficiency with participatory inclusivity. By advancing a more nuanced understanding of smart governance, this research provides policymakers, urban planners, and scholars with a foundation for designing and implementing governance systems that support the development of resilient, inclusive, and sustainable cities.

6. Conclusions

Smart governance offers transformative potential for addressing the multifaceted challenges of contemporary urbanization and advancing sustainability goals through the strategic use of technologies such as AI, IoT, and big data analytics. These innovations enable cities to optimize resource management, improve public service delivery, and enhance transparency and accountability in governance. Examples such as Singapore's Smart Nation initiative and Barcelona's participatory governance model illustrate how both technocentric and human-centric approaches can successfully respond to diverse urban contexts. These cases highlight the dual promise of technological innovation and inclusive decision-making in creating more adaptive and responsive urban systems. However, the path to widespread adoption remains obstructed by persistent challenges, including the digital divide, data privacy and security concerns, and institutional inertia within traditional governance structures. Compounding these challenges is the lack of standardized indicators and metrics for evaluating the effectiveness and outcomes of smart governance, making cross-contextual comparison and evidence-based policymaking difficult.

Addressing these issues requires an integrated approach that balances technological advancement with social equity, environmental responsibility, and local contextual needs. When grounded in inclusive policy frameworks, smart governance can drive sustainable urban development by aligning innovation with the principles of equity, resilience, and environmental stewardship. Strong data governance mechanisms will be essential to build public trust, ensure ethical safeguards, and prevent misuse. Hybrid governance models that combine digital efficiency with participatory, citizen-focused processes can help reshape urban planning in more inclusive and sustainable ways. At this point, this research offers an

invaluable critical perspective on the nexus of governance, technology, and sustainability, providing policymakers and urban practitioners with a roadmap for building resilient, future-ready cities capable of thriving in an era of rapid digital transformation.

Appendix A

Table A1. Smart governance challenges and critiques.

Study	Title	Journal	Aim	Challenge	Critique
Aguilera et al. [38]	“The Corporate Governance of Environmental Sustainability: A Review and Proposal for More Integrated Research”	Journal of Management	Analyze how corporate governance influences environmental sustainability.	Lack of consistent and comparable metrics for measuring corporate sustainability efforts.	The paper offers a broad review but lacks actionable strategies for corporations to integrate sustainability effectively.
Ahvenniemi et al. [39]	“What Are the Differences Between Sustainable and Smart Cities?”	Cities	Compare sustainable and smart city paradigms.	Lack of standardized frameworks for assessing smart cities’ sustainability.	The study lacks practical case studies, assumes technology neutrality, overlooks integration complexities, provides limited focus on social sustainability, and treats paradigms as static rather than evolving.
Akmenti [40]	“E-Participation and Engagement in Urban Planning: Experiences from the Baltic Cities”	Urban Research & Practice	Examine how e-participation functions in Baltic cities’ urban planning procedures.	Engaging citizens in meaningful participation remains a significant barrier.	The study highlights successful cases but fails to address the lack of digital infrastructure in less developed regions.
Allam et al. [56]	“Emerging Trends and Knowledge Structures of Smart Urban Governance”	Sustainability	Discuss the technological advancements in smart governance for urban sustainability.	Technological adoption barriers and resistance from legacy systems.	Fails to adequately examine how citizens’ involvement and local governments contribute to the adoption of new technologies.
Al-Nasrawi et al. [57]	“Smartness of Smart Sustainable Cities: a Multidimensional Dynamic Process Fostering Sustainable Development”	Fifth International Conference on Smart Cities, Systems, Devices	Develop a multidimensional model to assess the smartness of sustainable cities.	Defining and standardizing “smartness” as a measurable concept remains a challenge.	The paper proposes a novel model but lacks real-world case studies to validate its effectiveness.
Alonso [58]	“E-Participation and Local Governance: A Case Study”	Theoretical and Empirical Researches in Urban Management	Examine the impact of digital tools on citizen participation in local governance.	Low engagement of citizens despite digital tools.	Emphasizes the role of socio-economic factors but underplays the technological limitations of e-participation tools.
Angelidou et al. [59]	“Enhancing Sustainable Urban Development Through Smart City Applications”	Journal of Science and Technology Policy Management	Explore how smart city applications contribute to sustainable urban development.	Implementing smart city technologies requires large-scale investment and skilled labor.	Focuses primarily on technological solutions but does not sufficiently address socio-economic issues that may hinder implementation.

Table A1. Cont.

Study	Title	Journal	Aim	Challenge	Critique
Baud et al. [60]	“The Urban Governance Configuration: A Conceptual Framework for Understanding Complexity and Enhancing Transitions to Greater Sustainability in Cities”	Geography Compass	Propose a framework for conceptual analysis and comparison of urban governance arrangements and their dynamics in relation to sustainability transitions.	Various governance configurations within and between cities; how complex decision-making is combined in a specific time and space to produce decisions and outcomes based on a variety of knowledge; and how urban governance could change to more sustainable, inclusive forms of urban development.	In a complex world, this framework makes it possible to integrate key elements (discourses, actor networks, knowledge, and material processes) that influence urban development decisions and results in their social, economic, and environmental domains.
Benites and Simoes [41]	“Assessing Urban Sustainable Development Strategy: An Application of Smart City Sustainability Taxonomy”	Ecological Indicators	Develop a taxonomy for assessing smart city sustainability using ICT tools.	Inconsistent data quality and collection methods across cities.	The proposed taxonomy lacks flexibility for adaptation to diverse city structures and governance models.
Bibri and Krogstie [42]	“Generating a Vision for Smart Sustainable Cities of the Future: A Scholarly Backcasting Approach”	European Journal of Futures Research	Create a backcasting model for smart, sustainable cities of the future.	Integrating long-term goals with immediate urban policy demands presents challenges.	The backcasting approach is innovative, but practical examples are limited, raising concerns about the scalability of the proposed vision.
Biermann et al. [15]	“Transforming Governance and Institutions for Global Sustainability: Key Insights from the Earth System Governance”	Current Opinion in Environmental Sustainability	Examine governance challenges in addressing global environmental change.	Overlapping international and national governance systems.	The paper offers innovative frameworks but lacks practical solutions for integrating multiple governance systems.
Bowen et al. [19]	“Implementing the ‘Sustainable Development Goals’: Towards Addressing Three Key Governance Challenges—Collective Action, Trade-Offs, and Accountability”	Current Opinion in Environmental Sustainability	Identify three significant governance issues that are essential to achieving the SDGs: (i) fostering collective action by establishing inclusive decision-making forums for stakeholders from various sectors and scales; (ii) focusing on equity, justice, and fairness while making difficult trade-offs; and (iii) making sure that there are systems in place to hold societal actors accountable for their actions, investments, decisions, and results.	One of the biggest challenges facing sustainability science, civil society, and government is achieving the SDGs, which aim to minimize ecological harm, eliminate inequality, and provide resilient lifestyles.	The significance of the connections among these three governance challenges is emphasized, along with each of these challenges’ potential solutions.

Table A1. Cont.

Study	Title	Journal	Aim	Challenge	Critique
Castelnovo et al. [42]	Smart Cities Governance: The Need for a Holistic Approach to Assessing Urban Participatory Policy Making	Social Science Computer Review	Investigate the need for flexible governance models in smart cities.	Balancing technological progress with citizen engagement.	While insightful, the paper does not adequately address how smaller cities with fewer resources can implement these models effectively.
Clune and Zehnder [33]	The Three Pillars of Sustainability Framework: Approaches for Laws and Governance	Journal of Environmental Protection	Analyze the role of governance in shaping sustainability laws and frameworks.	Resistance from stakeholders to adopt sustainability-focused laws.	The paper critiques existing legal frameworks but fails to propose a unified global approach to sustainability governance.
Colding et al. [61]	“The Smart City Model: A New Panacea for Urban Sustainability or Unmanageable Complexity?”	Environment and Planning B: Urban Analytics and City Science	Explore whether smart cities genuinely lead to sustainability or create unmanageable complexity.	Lack of proper theories to address the complexity of smart city systems.	The paper questions the sustainability of smart cities but does not propose solutions for managing the growing complexity and potential energy costs.
Connor [62]	“The “Four Spheres” Framework for Sustainability”	Ecological Complexity	Propose a “Four Spheres” framework integrating economic, social, environmental, and political spheres.	The challenge of balancing economic activity with environmental and social goals.	Provides a thorough conceptual framework but lacks empirical evidence on the effectiveness of applying this framework in real-world governance.
Da Cruz et al. [63]	“New Urban Governance: A Review of Current Themes and Future Priorities”	Journal of Urban Affairs	To review contemporary themes and priorities in urban governance, highlighting governance networks and institutional structures.	Challenges include navigating complex and often conflicting urban policies, diverse stakeholder interests, and institutional reforms.	The study emphasizes the need for empirical backing in understanding urban governance while also acknowledging the limitations of purely technocratic approaches.
Das [64]	“Exploring the Symbiotic Relationship between Digital Transformation, Infrastructure, Service Delivery, and Governance for Smart Sustainable Cities”	Smart Cities	Discuss the role of technology in transforming urban governance towards sustainability.	Barriers to technology adoption in legacy governance systems.	The paper fails to fully account for socio-political challenges that hinder the adoption of smart technologies in urban governance.
Estevez and Janowski [65]	“Electronic Governance for Sustainable Development—Conceptual framework and state of research”	Government Information Quarterly	Explore the role of electronic governance (e-governance) in promoting sustainable development.	Challenges in integrating e-governance solutions across diverse governance frameworks.	The framework is well-defined but requires real-world application to validate its efficacy in diverse urban contexts.

Table A1. Cont.

Study	Title	Journal	Aim	Challenge	Critique
Ferreira and Ritta Coelho [66]	“Factors of Engagement in E-Participation in a Smart City”	ICEGOV 2022 Conference	Investigate the -factors that contribute to citizen participation in e-Governance platforms.	Low engagement rates are due to cultural and technological barriers.	The study provides good insights but does not suggest actionable solutions to overcome cultural barriers that hinder e-participation.
Fu and Zhang, 2017 [67]	“Trajectory of Urban Sustainability Concepts: A 35-Year Bibliometric Analysis”	Cities	Review the evolution of urban sustainability concepts over 35 years using bibliometric methods.	Many sustainability concepts are abstract and difficult to implement.	The paper provides an excellent historical review but lacks forward-looking perspectives on the future of urban sustainability initiatives.
Grossi and Welinder [68]	“Smart Cities at the Intersection of Public Governance Paradigms for Sustainability”	Urban Studies	Investigate how smart city governance intersects with public governance paradigms for sustainability.	Balancing technological innovations with governance models remains a significant challenge.	The paper introduces a novel framework but does not fully explore how this can be practically implemented in lower-income or less technologically advanced cities.
Haarstad and Wathne [69]	“Are Smart City Projects Catalyzing Urban Energy Sustainability?”	Energy Policy	Examine the links among smart cities and energy sustainability.	Measuring energy efficiency in smart city initiatives is difficult due to a lack of standardized metrics.	The paper emphasizes the potential of smart city initiatives but highlights that energy savings are not adequately measured or quantified.
Haarstad [70]	“Constructing the Sustainable City: Examining the Role of Sustainability in the ‘Smart City’ Discourse”	Journal of Environmental Policy & Planning	Examine how sustainability is framed within smart city initiatives, with a focus on European cities.	The concept of “smart cities” remains vague and is often driven by corporate interests.	The paper offers a critical perspective but could expand on actionable recommendations for policymakers to ensure sustainability plays a central role in smart city agendas.
He et al. [71]	“E-Participation for Environmental Sustainability in Transitional Urban China”	Sustainability Science	Analyze how ICT can unlock the full potential of e-governance strategies.	Limited access to ICT infrastructure in developing countries.	While the analysis is comprehensive, the paper does not sufficiently address the long-term sustainability of ICT projects in less developed regions.
He et al. [72]	“Legal Governance in the Smart Cities of China: Functions, Problems, and Solutions”	Sustainability	Explore legal governance issues and propose solutions to support China’s smart city governance.	Legal frameworks often lag technological advancements in smart city contexts.	The article provides useful insights but fails to address the broader international implications of China’s governance model.

Table A1. Cont.

Study	Title	Journal	Aim	Challenge	Critique
Herdiyanti et al. [73]	“Modelling the Smart Governance Performance to Support Smart City Program in Indonesia”	Procedia Computer Science	Compare seven smart city standards and evaluate their applicability in Indonesian cities.	Customizing global standards to local contexts remains a major challenge.	The study presents valuable comparative insights but lacks practical guidance on localizing smart city standards.
Huovila et al. [74]	“Comparative Analysis of Standardized Indicators for Smart Sustainable Cities: What Indicators and Standards to Use and When?”	Cities	Analyze and compare indicators used to assess smart sustainable cities across urban contexts.	Ensuring consistency in data collection across different cities remains difficult.	The paper highlights the need for a flexible framework that allows for adaptation to different urban environments.
Ibrahim et al. [75]	“Smart Sustainable Cities Roadmap: Readiness for Transformation towards Urban Sustainability”	Sustainable Cities & Society	Propose a roadmap for city planners and decision-makers for transforming traditional cities into SSCs.	Readiness for change in cities is often underestimated, leading to implementation failures.	The roadmap is useful for guiding city transformations, but the study lacks empirical validation through case studies.
Jiang [76]	“Smart urban governance in the ‘smart’ era: Why is it urgently needed?”	Cities	Analyze the characteristics and urgency of smart urban governance, providing a framework for understanding how smart governance can be implemented effectively.	Challenges include integrating technology with urban planning, addressing technocratic governance issues, and achieving citizen engagement.	While the study effectively highlights the importance of context-based smart urban governance, it could benefit from practical examples or case studies for real-world application.
Kato and Takizawa [77]	“Urban Transformation and Population Decline in Old New Towns in the Osaka Metropolitan Area”	Cities	To study the nonlinear relationship between population, decline, and urban transformation in old New Towns using XGBoost analysis.	Challenges include addressing the aging population, land use changes, and the effectiveness of urban planning strategies.	While the study provides valuable insights into the transformation process, it could consider more policy-oriented solutions to address the identified issues.
Lange et al. [78]	“Governing Towards Sustainability—Conceptualizing Modes of Governance”	Journal of Environmental Policy & Planning	Explore governance models that conceptualize sustainability transitions in urban contexts.	Conflict between short-term political cycles and long-term sustainability goals.	The study offers a comprehensive review but does not provide actionable solutions for overcoming political inertia.
Lim and Yigitcanla [10]	“Participatory Governance of Smart Cities: Insights from E-Participation of Putrajaya and Petaling Jaya, Malaysia”	Smart Cities	Examine how citizen participation can improve smart city governance in Penang and Puchong, Malaysia.	Engaging marginalized communities remains a significant barrier.	The article offers valuable insights but fails to address issues of accessibility and inclusivity in citizen participation strategies.

Table A1. Cont.

Study	Title	Journal	Aim	Challenge	Critique
Martin et al. [79]	“Smart-Sustainability: A New Urban Fix?”	Sustainable Cities & Society	Explore the potential of smart sustainability as a fix for urban economic, environmental, and social issues.	The smart sustainability concept is often driven by corporate interests, limiting its transformative potential.	The paper critiques the over-reliance on technological solutions and advocates for a more balanced approach to sustainability and governance.
Meuleman and Niestroy [80]	“Common But Differentiated Governance: A Metagovernance Approach to Make the SDGs Work”	Sustainability	Develop a metagovernance framework for achieving SDGs in cities.	Achieving consensus among diverse stakeholders is often difficult.	The metagovernance framework is promising but lacks concrete examples of successful implementation in complex urban environments.
Mooij [29]	“Smart Governance? Politics in the Policy Process in Andhra Pradesh, India”	Overseas Development Institute	Investigate the role of politics in the implementation of smart governance in Andhra Pradesh.	Lack of transparency and high levels of political interference in governance structures.	The study effectively analyzes political barriers but lacks specific recommendations on how to overcome them.
Mutiara et al. [3]	“Smart Governance for Smart City”	IOP Conference Series: Earth and Environmental Science	Examine the status of smart governance in Indonesian cities.	A lack of transparency and limited public participation in local governance structures.	The paper provides a strong analysis of e-governance but lacks empirical data on actual improvements in public service delivery.
Ochara [81]	“Grassroots Community Participation as a Key to e-Governance Sustainability in Africa”	The African Journal of Information and Communication	Explore how grassroots community participation enhances the sustainability of e-governance initiatives.	Limited technological infrastructure and digital literacy in African communities.	The study emphasizes community participation but underplays the technological challenges faced in rural areas.
Palacin et al. [82]	“Reframing E-Participation for Sustainable Development”	ICEGOV	Investigate the role of e-participation in achieving sustainable urban development.	Engaging marginalized communities in e-participation platforms remains difficult.	The paper highlights the potential of e-participation but lacks concrete examples of successful implementation in marginalized communities.
Paskaleva [83]	“Enabling the Smart City: The Progress of City E-Governance in Europe”	International Journal of Innovation and Regional Development	Analyze how e-governance can improve decision-making and citizen engagement in European cities.	E-governance adoption varies significantly across different European cities, limiting overall progress.	The paper provides comprehensive insights but lacks detailed case studies on cities with advanced e-governance.
Patterson et al. [84]	“Exploring the Governance and Politics of Transformations Towards Sustainability”	Environmental Innovation and Societal Transitions	Explore how governance can facilitate transitions toward sustainability, particularly in urban settings.	Aligning political agendas with long-term sustainability goals is challenging.	The study provides a thorough theoretical framework but lacks real-world policy recommendations.

Table A1. Cont.

Study	Title	Journal	Aim	Challenge	Critique
Rahman et al. [85]	“From E-Governance to Smart Governance: Policy Lessons for the UAE”	Global Encyclopedia of Public Administration, Public Policy, and Governance	Provide policy recommendations for transitioning from e-governance to smart governance in the UAE.	Limited integration of technology across different government sectors remains a key challenge.	The paper provides insightful policy suggestions but does not explore potential cultural barriers to adoption.
Rochet and Belemlih [86]	“Social Emergence, Cornerstone of Smart City Governance as a Complex Citizen-Centric System”	Handbook of Smart Cities	Explore how social emergence plays a key role in smart city governance models.	Balancing technological advancement with citizen participation remains difficult.	The article presents a well-rounded framework but lacks empirical evidence on the real-world impacts of social emergence on governance.
Tewari and Datt [87]	“Towards FoT (Fog-of-Things) enabled Architecture in Governance: Transforming E-Governance to Smart Governance”	International Conference on Intelligent Engineering and Management (ICIEM)	Propose a FoT-based architecture for transforming e-Governance to smart governance.	High latency and security issues in IoT-based e-Governance.	The solution is promising but requires more real-world testing to address scalability and security concerns.
Toli and Murtagh [88]	“The Concept of Sustainability in Smart City Definitions”	Frontiers in Built Environment	Review existing smart city definitions, focusing on their sustainability dimensions and propose an updated definition.	The lack of a consistent, universally accepted definition of “smart city” across the literature.	The review is thorough but lacks empirical case studies to test the proposed definition’s effectiveness in practice.
Turnheim et al. [89]	“Evaluating Sustainability Transitions Pathways: Bridging Analytical Approaches to Address Governance Challenges”	Global Climate Change	Create an integrated systems model that addresses the complexities of sustainability transitions.	Managing the complexity of multiple systems within environmental and social transitions.	The model is comprehensive but may be too complex to apply in practical policymaking without significant adaptation.
Yahia et al. [90]	“Towards Sustainable Collaborative Networks for Smart Cities Co-Governance”	International Journal of Information Management	Explore how collaborative networks of informatics can be leveraged for effective governance in smart cities.	The challenge of integrating diverse informatics systems across multiple governance levels.	The study provides valuable insights but lacks a clear roadmap for the real-world implementation of these collaborative networks.
Yigitcanlar and Kamruzzaman [32]	“Does Smart City Policy Lead to Sustainability of Cities?”	Land Use Policy	Investigate the policies that support smart cities and their role in promoting urban sustainability.	Difficulty in translating policy into effective on-the-ground sustainability improvements.	The paper presents a strong policy analysis but lacks examples of successful implementation in varied urban contexts.

Table A1. *Cont.*

Study	Title	Journal	Aim	Challenge	Critique
Zachary and Jared [91]	“Characterizing E-Participation Levels in E-Governance”	International Journal of Scientific Research and Innovative Technology	Analyze the role of ICT in enhancing citizen participation in e-governance and assess e-participation levels.	Balancing the accessibility of ICT with equitable citizen participation.	While the study highlights important factors in e-governance, it doesn’t address how to overcome the digital divide that may limit participation.
Zhu et al. [92]	“How Different Can Smart Cities Be? A Typology of Smart Cities in China”	Cities	Examine and classify the diverse characteristics of smart cities in China, using a comprehensive framework.	Addressing the varied nature of smart city development and differences in regional contexts within China.	The study provides an in-depth classification but might benefit from broader comparisons with global smart cities to understand China’s unique positioning.

Table A2. Comparative analysis of smart governance frameworks in various cities.

Study	City	Governance Model	Key Technologies	Impact on Sustainability	Citizen Engagement
Chia [95]	Singapore	Smart nation initiative	AI, IoT, blockchain	Improved service delivery, enhanced urban mobility, sustainable urban planning	Public engagement via digital platforms
Hao et al. [108]	Kenya	Enhancing public participation in governance	ICT, AI	Strengthened public engagement, enhanced decision-making and transparency	Grassroots participation, digital services for marginalized communities
Müller [31]	Leuven City	Smart city initiatives	Digital platforms, AI	Enhanced business processes, simplified public services	Active engagement through e-platforms
Pieterse [106]	Johannesburg	Urban governance and spatial transformation ambitions	Digital platforms, GIS	Focuses on reducing urban fragmentation and supporting sustainable development	Grassroots-level public participation, local councils (baraza and indaba)
Sarv & Soe [100]	Tallinn, Estonia	Unified smart city model	e-government platforms, AI	Increased efficiency in public service delivery	Public participation through e-governance portals
Vatsa & Chhapparwal [101]	Estonia	E-government and participatory governance	Digital platforms, blockchain	Transparency in public services, enhanced citizen-government interactions	High levels of digital participation
Yigitcanlar & Bulu [27]	Istanbul, Turkey	Knowledge-based urban development	Digital platforms, AI, urban analytics	Increased competitiveness and sustainable economic development	Community involvement through digital platforms

Table A3. Comparison of technocentric and human-centric governance models.

Study	City	Governance Model	Key Features	Advantages	Challenges	Approach
Chia [95]	Singapore	Smart nation	AI, IoT, big data analytics	High efficiency, real-time decision-making	Risks citizen disengagement, digital divide	Technocentric
Vatsa & Chhapparwa [101]	Estonia	E-government	Blockchain, e-participation platforms	Increased transparency, digital efficiency	Access for marginalized populations	Technocentric
Aragón et al. [96]	Barcelona	Decidim (participatory)	E-participation, community-driven policies	High citizen engagement, inclusive decision-making	Slower decision-making, reliance on consultation	Human-centric
Corburn et al. [97]	Medellín	City for Life	Community involvement, grassroots participation	Social cohesion, reduction in crime, inclusivity	Resource-intensive, slower response times	Human-centric
Ylipulli & Luusua [113]	Helsinki	Citizen-centric smart city	AI-driven services with public feedback mechanisms	Balances technology with public needs	Ensuring equal access to digital platforms	Balanced
Huh et al. [121]	Songdo	Technological infrastructure focus	IoT, big data, automated systems	Fully integrated infrastructure, optimized services	Limited citizen participation, corporate-driven	Technocentric
Griffiths & Sovacool [122]	Masdar	Sustainable tech-centric governance	IoT, energy-efficient technologies	Environmentally sustainable, energy-efficient	Top-down approach, limited public engagement	Technocentric
Putra & van der Knaap [25]	Amsterdam	Smart city framework	IoT, data platforms, urban dashboards	Efficient mobility, smart infrastructure	Integrating citizen feedback with technological systems	Balanced

Table A4. Literature on governance with farmwork focus.

Study	Title	Journal	Framework	Outcome
Aguilera et al. [38]	“The Corporate Governance of Environmental Sustainability: A Review and Proposal for More Integrated Research”	Journal of Management	Governance and policy frameworks	Identifies research gaps in governance roles for sustainability, proposing solutions for comprehensive frameworks and future studies.
Ahvenniemi et al. [39]	“What Are the Differences Between Sustainable and Smart Cities?”	Cities	Smart cities and sustainability frameworks	Smart city frameworks emphasize technology, while sustainable frameworks focus more on environmental aspects. Suggests merging both models.

Table A4. Cont.

Study	Title	Journal	Framework	Outcome
Akmentina [40]	“E-Participation and Engagement in Urban Planning: Experiences from the Baltic cities”	Urban Research & Practice	E-participation and citizen-centric governance frameworks	Highlights how ICT tools improve transparency and public engagement but notes challenges in meaningful citizen involvement.
Allam et al. [56]	“Emerging Trends and Knowledge Structures of Smart Urban Governance”	Sustainability	Analytical and comparative frameworks	Shows increasing focus on citizen participation and technology adoption in urban governance, identifying future research directions.
Al-Nasrawi et al. [57]	“Smartness of Smart Sustainable Cities: a Multidimensional Dynamic Process Fostering Sustainable Development”	Fifth International Conference on Smart Cities, Systems, Devices	Smart cities and sustainability frameworks	Demonstrates the reciprocal relationship between smartness and sustainable development goals.
Alonso [58]	“E-Participation and Local Governance: A Case Study”	Theoretical and Empirical Researches in Urban Management	E-participation and citizen-centric governance frameworks	Demonstrates both potential and limitations of e-participation; points to political marketing risks outweighing real participation.
Angelidou et al. [59]	“Enhancing Sustainable Urban Development through Smart City Applications”	Journal of Science and Technology Policy Management	Smart cities and sustainability frameworks	Identifies fragmentation in smart city approaches and recommends policy improvements to promote sustainable urban growth.
Baud et al. [60]	“The Urban Governance Configuration: A Conceptual Framework for Understanding Complexity and Enhancing Transitions to Greater Sustainability in Cities”	Geography Compass	Governance and policy frameworks	Offers insights into improving urban governance through more inclusive and sustainable strategies, focusing on knowledge management.
Benites & Simoes [41]	“Assessing Urban Sustainable Development Strategy: An Application of Smart City Sustainability Taxonomy”	Ecological Indicators	Analytical and comparative frameworks	Identifies a shift towards economic-focused smart city solutions, recommending broader inclusion of social and environmental indicators.
Bibri & Krogstie [42]	“Generating a Vision for Smart Sustainable Cities of the Future: A Scholarly Backcasting Approach”	European Journal of Futures Research	Smart cities and sustainability frameworks	Proposes strategic pathways to combine technology with sustainability, addressing long-term urban challenges and smart city evolution.

Table A4. Cont.

Study	Title	Journal	Framework	Outcome
Biermann et al. [15]	“Transforming Governance and Institutions for Global Sustainability: Key Insights from the Earth System Governance”	Current Opinion in Environmental Sustainability	Governance and policy frameworks	Advocates for transformative global governance to address sustainability challenges, emphasizing institutional reform.
Bowen et al. [19]	“Implementing the ‘Sustainable Development Goals’: towards addressing three key governance challenges—collective action, trade-offs, and accountability”	Current Opinion in Environmental Sustainability	Governance and policy frameworks	Highlights governance challenges in SDG implementation and suggests solutions to overcome institutional barriers.
Castelnovo et al. [43]	“Smart Cities Governance: The Need for a Holistic Approach to Assessing Urban Participatory Policy Making”	Social Science Computer Review	Governance and policy frameworks	Promotes citizen engagement and participatory governance as essential for evaluating smart city policies’ impact.
Clune & Zehnder [33]	“The Three Pillars of Sustainability Framework: Approaches for Laws and Governance”	Journal of Environmental Protection	Conceptual and development-oriented frameworks	Emphasizes the importance of integrated approaches for successful sustainability efforts across various domains.
Colding et al. [61]	“The Smart City Model: A New Panacea for Urban Sustainability or Unmanageable Complexity?”	Environment and Planning B: Urban Analytics and City Science	Smart cities and sustainability frameworks	Warns about the risks of excessive urban complexity and energy consumption, suggesting thoughtful ICT integration.
Connor [62]	“The ‘Four Spheres’ Framework for Sustainability”	Ecological Complexity	Conceptual and development-oriented frameworks	Provides a governance model emphasizing interconnected systems to achieve sustainability through balanced decision-making.
Da Cruz et al. [63]	“New Urban Governance: A Review of Current Themes and Future Priorities”	Journal of Urban Affairs	Analytical and comparative frameworks	Identifies governance challenges such as fiscal autonomy, political engagement, and citizen participation.
Das [64]	“Exploring the Symbiotic Relationship between Digital Transformation, Infrastructure, Service Delivery, and Governance for Smart Sustainable Cities”	Smart Cities	Conceptual and development-oriented frameworks	Emphasizes the need for synchronized governance and infrastructure to achieve smart and sustainable cities.

Table A4. Cont.

Study	Title	Journal	Framework	Outcome
Estevez & Janowski [65]	“Electronic Governance for Sustainable Development—Conceptual Framework and State of Research”	Government Information Quarterly	Conceptual and development-oriented frameworks	Highlights the role of ICT in facilitating sustainable development through better governance practices.
Ferreira & Ritta Coelho [66]	“Factors of Engagement in E-Participation in a Smart City”	ICEGOV 2022 Conference	E-participation and citizen-centric governance frameworks	Identifies challenges in maintaining citizen engagement through ICT platforms and offers suggestions for improvement.
Fu & Zhang [67]	“Trajectory of Urban Sustainability Concepts: A 35-Year Bibliometric Analysis”	Cities	Analytical and comparative frameworks	Shows how concepts like smart cities and sustainable cities overlap and evolve, promoting integrated frameworks for urban sustainability.
Grossi & Welinder [68]	“Smart Cities at the Intersection of Public Governance Paradigms for Sustainability”	Urban Studies	Analytical and comparative frameworks	Demonstrates how smart city governance can achieve social, economic, and environmental sustainability outcomes.
Haarstad & Wathne [69]	“Are Smart City Projects Catalyzing Urban Energy Sustainability?”	Energy Policy	Analytical and comparative frameworks	Smart city projects increase ambition for energy sustainability but face challenges in accountability.
Haarstad [70]	“Constructing the Sustainable City: Examining the Role of Sustainability in the ‘Smart City’ Discourse”	Journal of Environmental Policy & Planning	Analytical and comparative frameworks	Highlights the weak focus on sustainability within smart city strategies, driven by economic priorities.
He et al. (2017) [71]	“E-Participation for Environmental Sustainability in Transitional Urban China”	Sustainability Science	E-participation and citizen-centric governance frameworks	Emphasizes the role of ICTs in empowering public engagement but notes barriers to participation in China.
He et al. (2022) [72]	“Legal Governance in the Smart Cities of China: Functions, Problems, and Solutions”	Sustainability	Governance and policy frameworks	Identifies challenges in data governance, recommending improved legal frameworks to support smart city development.
Herdiyanti et al. [73]	“Modelling the Smart Governance Performance to Support Smart City Program in Indonesia”	Procedia Computer Science	Analytical and comparative frameworks	Provides insights into challenges of implementing smart city initiatives in Indonesia without standardized frameworks.

Table A4. Cont.

Study	Title	Journal	Framework	Outcome
Huovila et al. [74]	“Comparative Analysis of Standardized Indicators for Smart Sustainable Cities: What Indicators and Standards to Use and When?”	Cities	Analytical and comparative frameworks	Offers practical recommendations for selecting appropriate indicators based on urban sustainability goals.
Ibrahim et al. [75]	“Smart Sustainable Cities Roadmap: Readiness for Transformation towards Urban Sustainability”	Sustainable Cities & Society	Smart cities and sustainability frameworks	Proposes phases to assess city readiness for change, considering local challenges and opportunities.
Jiang [76]	“Smart Urban Governance in the ‘Smart’ Era: Why Is It Urgently Needed?”	Cities	Governance and policy frameworks	Advocates for a shift from technology-driven to demand-pulled governance, focusing on urban issues.
Kato & Takizawa [77]	“Urban Transformation and Population Decline in Old New Towns in the Osaka Metropolitan Area”	Cities	Conceptual and development-oriented frameworks	Highlights the shift in New Towns from child-centric to elderly-centric urban structure.
Lange et al. [78]	“Governing Towards Sustainability—Conceptualizing Modes of Governance”	Journal of Environmental Policy & Planning	Governance and policy frameworks	Suggests multi-dimensional governance focusing on politics, policy, and polity aspects.
Lim & Yigitcanla [10]	“Participatory Governance of Smart Cities: Insights from E-Participation of Putrajaya and Petaling Jaya, Malaysia”	Smart Cities	E-participation and citizen-centric governance frameworks	Identifies political and institutional challenges in achieving effective participatory governance in Malaysia.
Martin et al. [79]	“Smart Sustainability: A New Urban Fix?”	Sustainable Cities & Society	Smart cities and sustainability frameworks	Critiques smart-sustainability initiatives as amplifying ecological modernization without true transformation.
Meuleman & Niestroy [80]	“Common But Differentiated Governance: A Metagovernance Approach to Make the SDGs Work”	Sustainability	Governance and policy frameworks	Recommends situationally appropriate governance to enhance SDG implementation efforts.
Mooij [29]	“Smart Governance? Politics in the Policy Process in Andhra Pra-desh, India”	Overseas Development Institute	Conceptual and development-oriented frameworks	Highlights contradictions in governance reform and policy implementation in Andhra Pradesh.
Mutiara et al. [3]	“Smart Governance for Smart City”	IOP Conference Series: Earth and Environmental Science	Smart cities and sustainability frameworks	Evaluates the effectiveness of e-governance and public information disclosure laws in Indonesia.

Table A4. Cont.

Study	Title	Journal	Framework	Outcome
Ochara [81]	“Grassroots Community Participation as a Key to e-Governance Sustainability in Africa”	“The African Journal of Information and Communication”	E-participation and citizen-centric governance frameworks	Emphasizes the need for community involvement in e-governance to reduce digital divides
Palacin et al. [82]	“Reframing E-Participation for Sustainable Development”	“ICEGOV”	E-participation and citizen-centric governance frameworks	Demonstrates how e-participation supports sustainable development and aligns with the 2030 Agenda.
Paskaleva [83]	“Enabling the Smart City: The Progress of City e-Governance in Europe”	International Journal of Innovation and Regional Development	Conceptual and development-oriented frameworks	Highlights the need for integrated e-services and partnerships to support smart governance.
Patterson et al. [84]	“Exploring the governance and Politics of Transformations Towards Sustainability”	Environmental Innovation and Societal Transitions	Governance and policy frameworks	Identifies challenges in sustainability transitions and emphasizes the importance of political alignment.
Rahman et al. [85]	“From E-Governance to Smart Governance: Policy Lessons for the UAE”	Global Encyclopedia of Public Administration, Public Policy, and Governance	Governance and policy frameworks	Analyzes the UAE’s success and challenges in adopting smart governance practices, with policy recommendations for improvement.
Rochet & Belemlih [86]	“Social Emergence, Cornerstone of Smart City Governance as a Complex Citizen-Centric System”	Handbook of Smart Cities	E-participation and citizen-centric governance frameworks	Highlights how bottom-up dynamics drive smart governance, using Barcelona and Medellín as case studies.
Tewari & Datt [87]	“Towards FoT (Fog-of-Things) Enabled Architecture in Governance: Transforming e-Governance to Smart Governance”	International Conference on Intelligent Engineering and Management (ICIEM)	Conceptual and development-oriented frameworks	Proposes a decentralized architecture for smart governance to enhance efficiency and real-time decision-making.
Toli & Murtagh [88]	“The Concept of Sustainability in Smart City Definitions”	Frontiers in Built Environment	Smart cities and sustainability frameworks	Identifies inconsistencies in smart city definitions and suggests aligning them with sustainability goals.
Turnheim et al. [89]	“Evaluating Sustainability Transitions Pathways: Bridging Analytical Approaches to Address Governance Challenges”	Global Climate Change	Conceptual and development-oriented frameworks	Offers a holistic approach to evaluate sustainability transitions and overcome governance challenges.

Table A4. Cont.

Study	Title	Journal	Framework	Outcome
Yahia et al. [90]	“Towards Sustainable Collaborative Networks for Smart Cities Co-Governance”	International Journal of Information Management	Analytical and comparative frameworks	Identifies organizational structures promoting robust and sustainable collaboration among stakeholders.
Yigitcanlar & Kamruzzaman [32]	“Does Smart City Policy Lead to Sustainability of Cities?”	Land Use Policy	Smart cities and sustainability frameworks	Reveals that the link between smart cities and reduced CO ₂ emissions is not linear, recommending better policy alignment.
Zachary & Jared [91]	“Characterizing E-Participation Levels in E-Governance”	International Journal of Scientific Research and Innovative Technology”	E-participation and citizen-centric governance frameworks	Highlights gaps in citizen engagement and offers recommendations to improve transparency and accountability.
Zhu et al. [92]	“How Different Can Smart Cities Be? A Typology of Smart Cities in China”	Cities	Smart cities and sustainability frameworks	Provides a typology identifying five distinct types of smart cities based on governance and technological approaches.
