

Supplementary materials

S1 Variations in cumulated C-CO₂ quantities of OWP expressed in gC-CO₂ 100 g⁻¹ of organic carbon of OWP (hypothesis 2)

The calculations for the Hypothesis 2 (Figure S1) were done as follows:

$$C_i\% = \frac{oC_{si} - oC_s}{OC_i} \times 100$$

$$C_{ij}\% = \frac{oC_{sij} - oC_{sj}}{OC_i} \times 100$$

Where $C_i\%$ is the cumulated carbon quantity (in gC-CO₂ 100 g⁻¹ of OC) emitted by the ith OWP; oC_{si} is the observed cumulated carbon quantity (on gC-CO₂) emitted by the microcosm containing soil + ith OWP; oC_s is the observed cumulated carbon quantity (in gC-CO₂) emitted by the microcosm containing soil alone; OC_i is the organic carbon quantity (in gOC) provided by the ith OWP; $C_{ij}\%$ is the cumulated carbon quantity (in gC-CO₂ 100 g⁻¹ of OC) emitted by the ith OWP and jth BM combination; oC_{sij} is the observed cumulated carbon quantity (in gC-CO₂) emitted by the microcosm containing soil + ith OWP + jth BM; oC_{sj} is the observed cumulated carbon quantity (in gC-CO₂) emitted by the microcosm containing soil + jth BM.

Figure S1

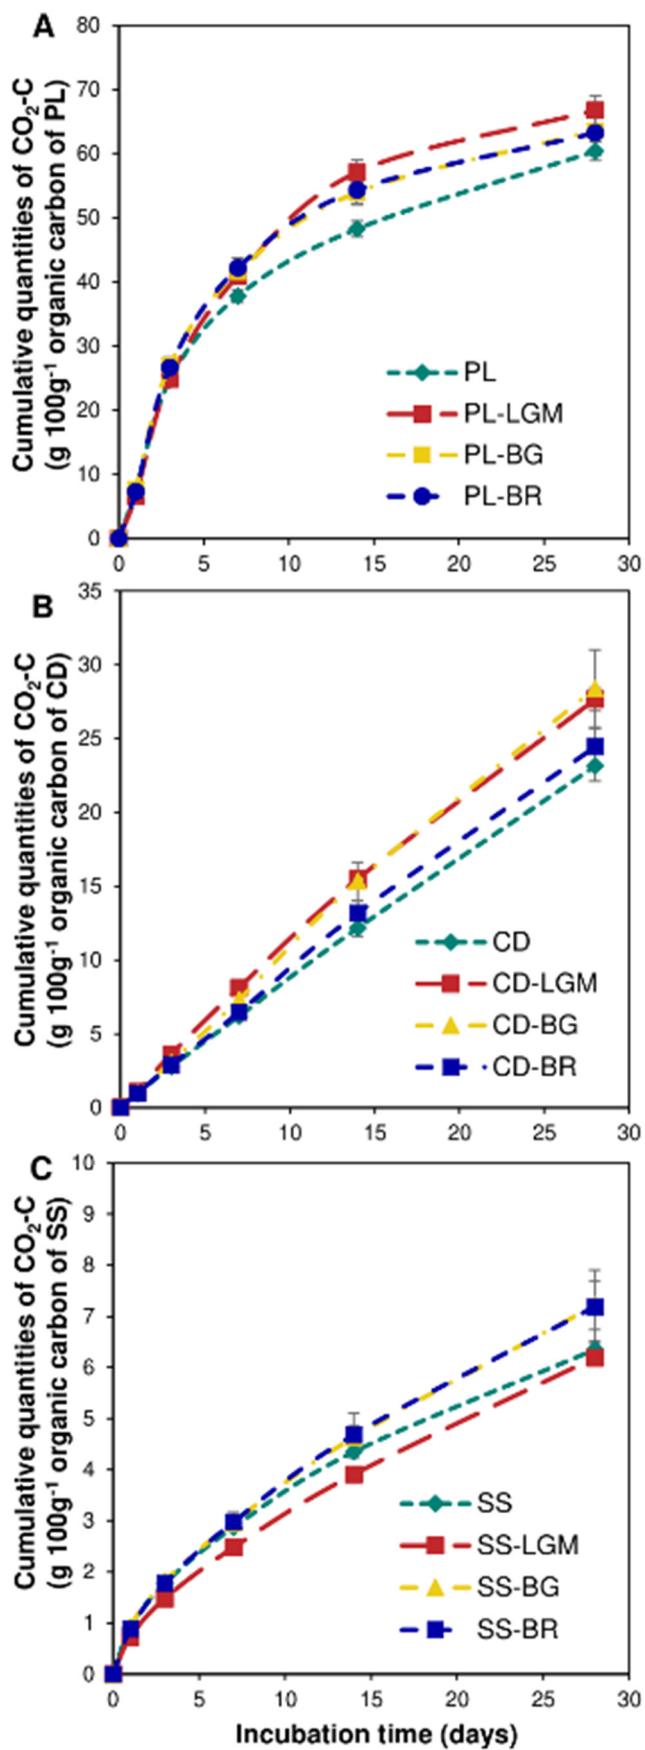

Figure S1 Variations in cumulated C- CO_2 quantities of OWP expressed in $\text{gC-CO}_2 \text{ 100 g}^{-1}$ of organic carbon of OWP (hypothesis 2). OWP organic waste products, BM local beneficial microorganisms, S soil, CD cow dung, PL poultry litter, SS sewage sludge, LGM groundnut + millet from Saint-Louis, BG

groundnut from the southern groundnut basin, BR rice from the southern groundnut basin. Error bars correspond to the standard deviation of three replicates

S2 Impact of OWP or BM on microcosm dissolved organic carbon

A 15 ml volume of a soil:water suspension (1:5) filtered at 0.22 µm and acidified with 2% ultrapure HNO₃ was used. The dissolved organic carbon (DOC) of the microcosms and the control were measured using a Shimadzu TOC Analyzer.

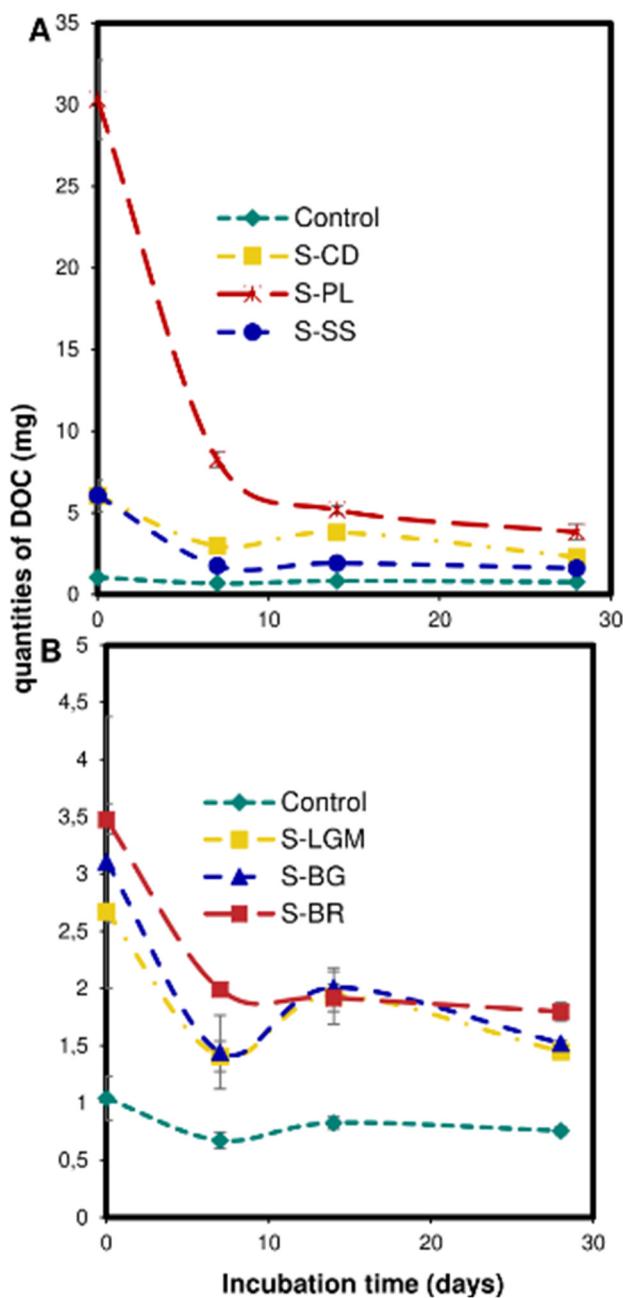

Figure S2 Variations in DOC quantities in microcosms expressed in mgDOC. DOC dissolved organic carbon, S soil, CD cow dung, PL poultry litter, SS sewage sludge, LGM groundnut + millet from Saint-

Louis, BG groundnut from the southern groundnut basin, BR rice from the southern groundnut basin. Error bars correspond to the standard deviation of three replicates

OWP or BM input increased the microcosm DOC quantities (Figure S2). DOC quantities in the S-OWP and S-BM microcosms were significantly higher ($p<0.0001$) than in the control. Yet the DOC quantities in the S-OWP microcosms (Figure S2a) were higher than in the S-BM microcosms (Figure S2b). DOC quantities in the S-OWP and S-BM microcosms decreased with increasing incubation time. The S-OWP microcosms, according to their DOC quantities, were ranked as follows: S-PL > S-CD > S-SS ($p<0.0001$, Figure S2a). S-BM microcosms, according to their DOC quantities, were ranked as follows: S-BR \geq S-BG = S-LGM ($p<0.0001$, Figure S2b).

S3. Impact of OWP or BM on microcosm pH

A soil:water suspension (1:5) was used to measure the pH of the microcosms and the control using a MultiLine® WTW Multi-parameter portable meter.

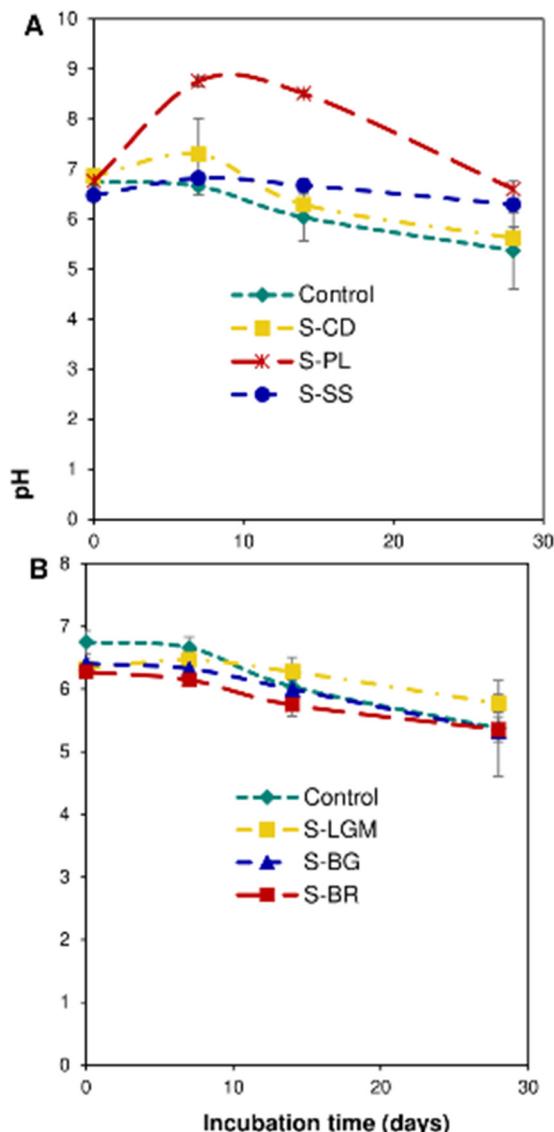

Figure S3 Variations in microcosm pH. S soil, CD cow dung, PL poultry litter, SS sewage sludge, LGM groundnut + millet from Saint-Louis, BG groundnut from the southern groundnut basin, BR rice from the southern groundnut basin. Error bars correspond to the standard deviation of three replicates

PL input led to an increase in microcosm pH, which remained higher than that of the control, S-SS and S-CD microcosms ($p<0.01$, Figure S3a). S-OWP microcosms, according to their pH, were ranked as follows: S-PL > S-CD = S-SS. BMs had no impact on the microcosm pH ($p>0.05$, Figure S3b).
