

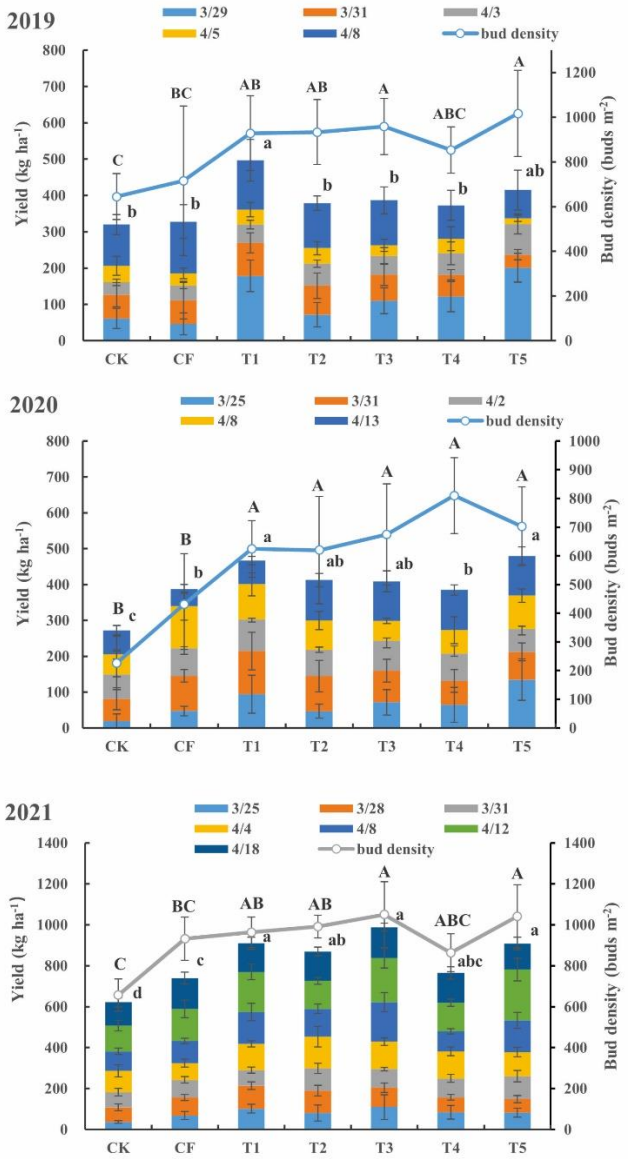

Figure S1. Effects of different fertilization modes on tea yield and bud density in 2019, 2020 and 2021. CK, no fertiliser; CF, conventional fertiliser; T1, tea-specific formula fertiliser; T2, T1 + acidification amendment; T3, organic substitution based on T1; T4, urea formaldehyde slow-release fertiliser; T5, carbon-based organic fertiliser. The data are expressed as means ± SD. Lowercase and uppercase letters represent significant differences of yield and bud density among treatments at a significance level of $P < 0.05$ respectively. Legends represented different sampling dates.
