

Development of Colorimetric Reverse Transcription Loop-Mediated Isothermal Amplification Assay for Detecting Feline Coronavirus

Witsanu Rapichai, Wichayet Saejung, Kotchaporn Khumtong, Chaiwat Boonkaewwan, Supansa Tuanthap, Peter A. Lieberzeit, Kiattawee Choowongkamon and Jatuporn Rattanasrisomporn

Figure S1. Gradient temperature optimization of RT-LAMP assay in the range 50–70°C. Pink color indicates positive reaction and yellow color indicates negative reaction. NTC, negative control.

Figure S2. Effect of amplification times on RT-LAMP assay. Pink color indicates positive reaction and yellow color indicates negative reaction. NTC, negative control.

Figure S3. Effect of $MgCl_2$ concentrations on RT-LAMP assay. Pink color indicates positive reaction and yellow color indicates negative reaction. NTC, negative control.

Figure S4. Effect of dNTP concentrations on RT-LAMP assay. Pink color indicates positive reaction and yellow color indicates negative reaction. NTC, negative control.

Figure S5. Primer requirement. Pink color indicates positive reaction and yellow color indicates negative reaction. NTC, negative control, IP, inner primers, LP, loop primers, and All, inner-, outer-, and loop primers.

Table S1. Clinical samples were tested with conventional PCR and RT-LAMP using the NR-based method and agarose gel electrophoresis method.

Name	Specimen	PCR F7-R7Sc	RT-LAMP	
			neutral red-based	agarose gel
