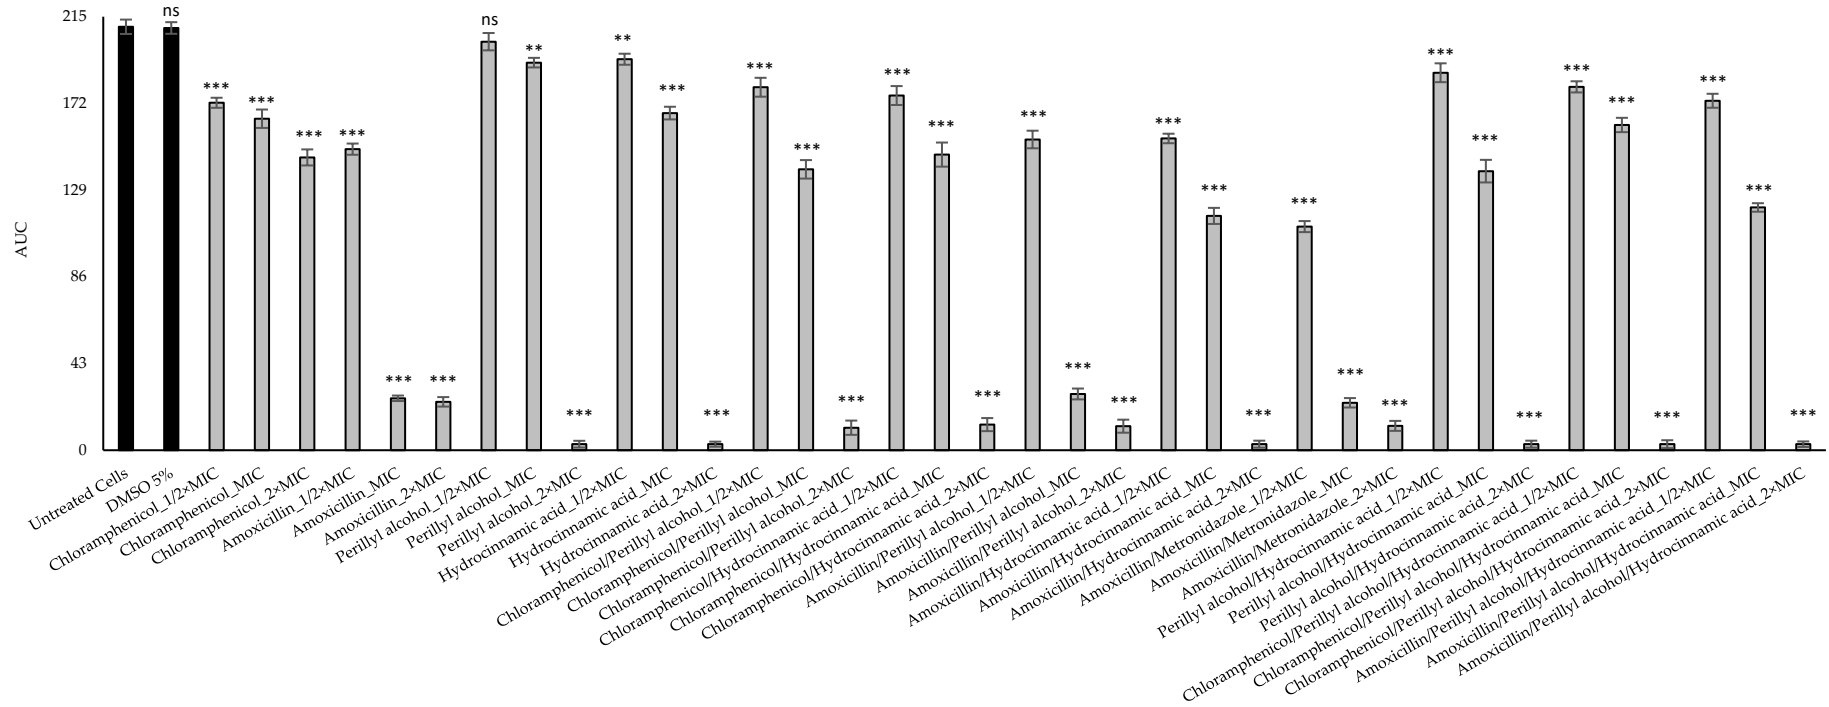

Figure S1. AUCs values for the time-kill curves. The number of stars indicates the level of statistical significance of the difference between untreated cells and *E. coli* exposed to each treatment: (**) for a p-value less than 0.05 and (***) for a p-value less than 0.01. When the statistical difference was not significant, ns was displayed. Values are the mean \pm standard deviation for at least two independent experiments.
