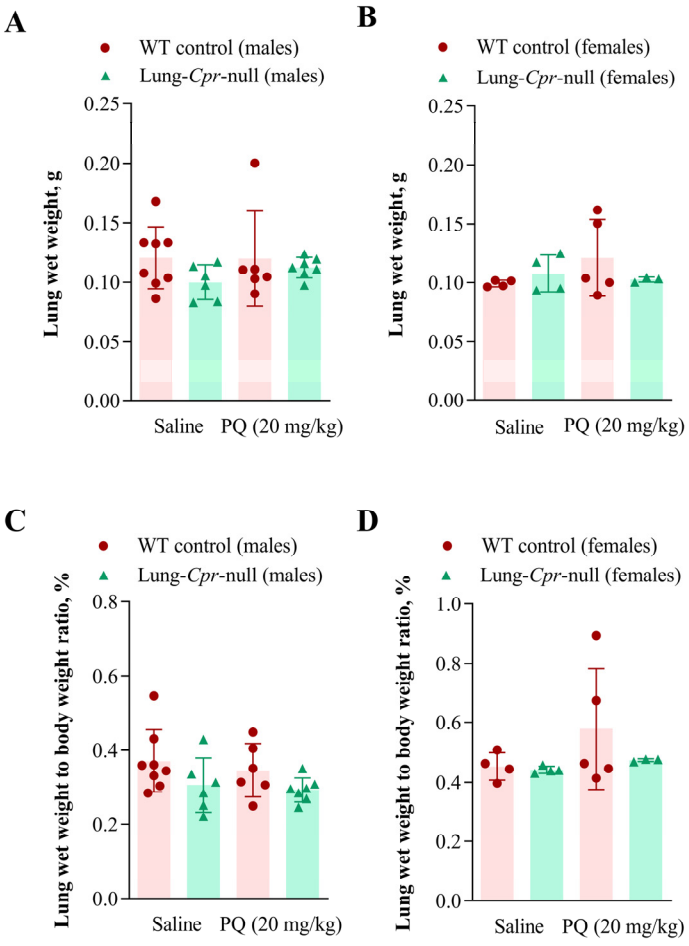

Figure S1. Lung weights for mice challenged with saline or 20 mg/kg PQ. Male (A, C) and female (B, D) lung-*Cpr*-null mice and their WT control littermates received a single intraperitoneal injection of 20 mg/kg PQ in saline or saline alone. The lung weights (A, B) or "lung-weight to body-weight" ratios (C, D) determined on day 15 after the challenge are reported. Values are means ± S.D. (n = 3–8).

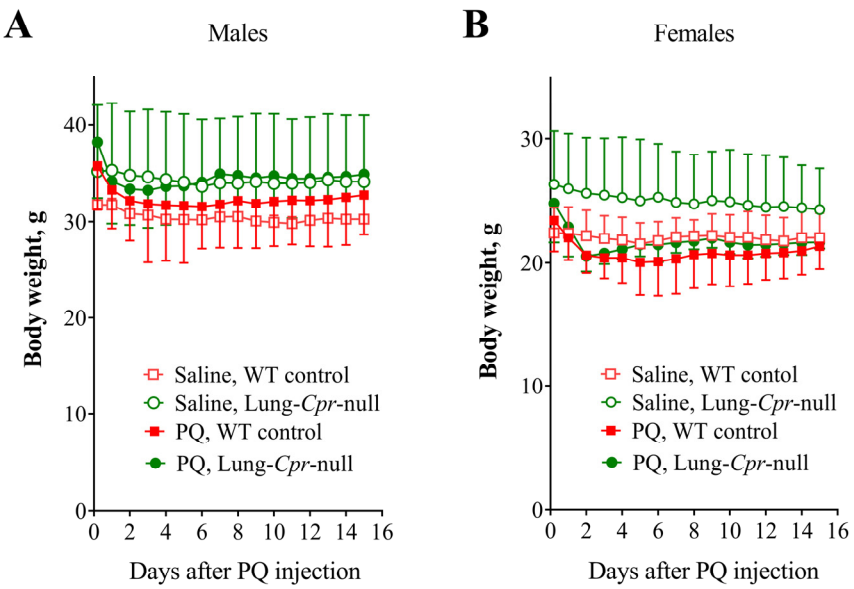

Figure S2. Body weights for mice challenged with saline or 20 mg/kg PQ. Male (A) and female (B) lung-*Cpr*-null mice and their WT control littermates received a single intraperitoneal injection of 20 mg/kg PQ in saline or saline alone. Values are means ± S.D. (n = 3–4).
