Supplementary Results

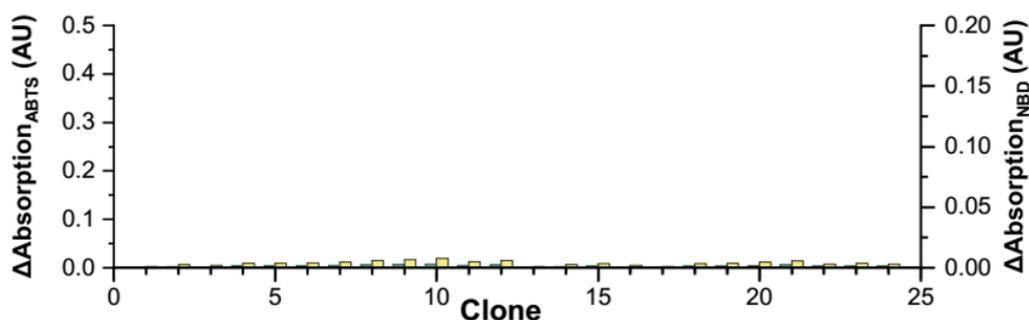

(a) *rCabUPO1*

(b) *rCabUPO2*

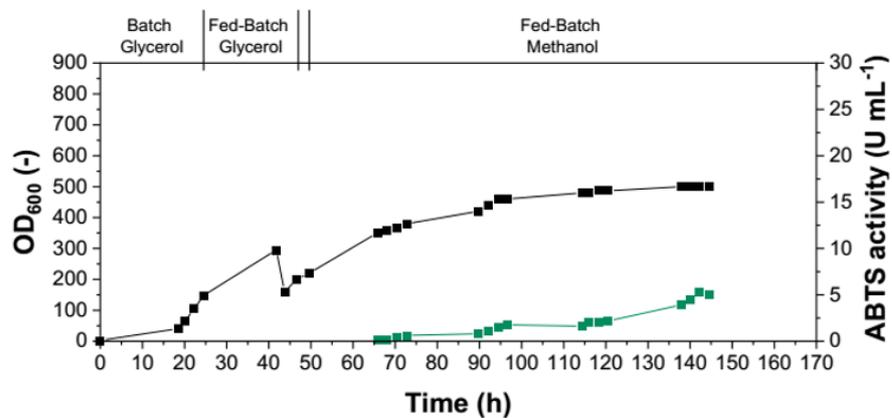

(c) *rAniUPO*

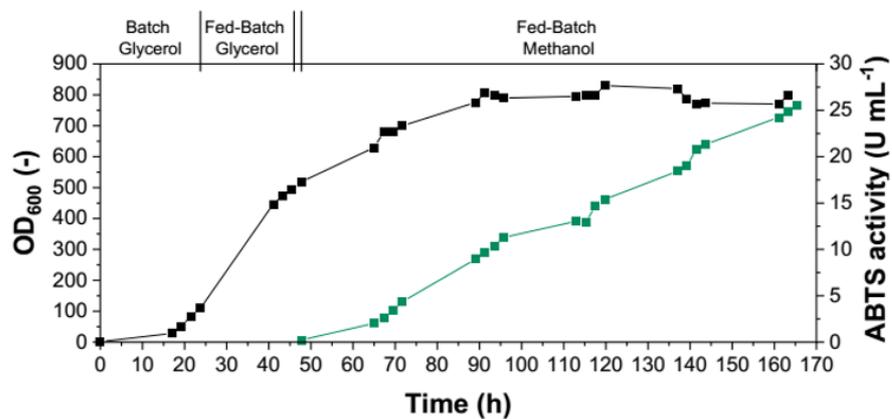

(d) *rMgaUPO*

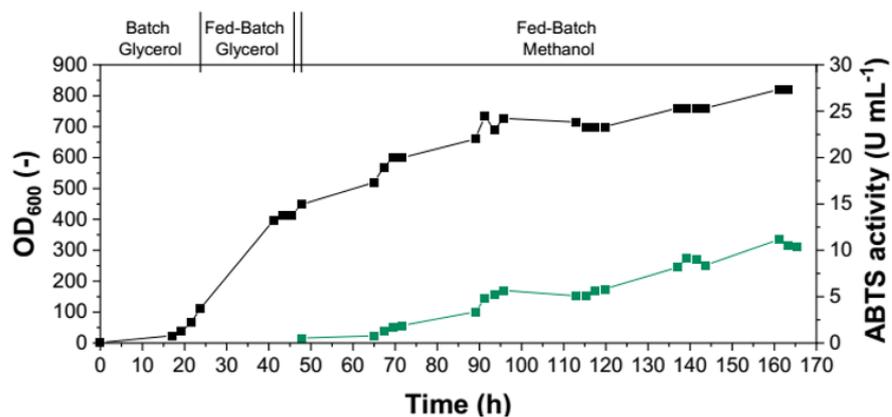

SI Figure S1: Screening of supernatant of *P. pastoris* clones transformed with UPO expression plasmids for activity using ABTS (■) and NBD (■) assays after cultivation in deep well plates for 94 h. The activity was determined by means of an endpoint measurement after 30 min of reaction time. *rMgaUPO* (d) exemplarily depicts a screening yielding no active clones. Clones chosen for subsequent larger scale production were: *rCabUPO* 1, clone 11, *rCabUPO* 2, clone 16, *rAniUPO*, clone 15.

(a) *rCabUPO1*

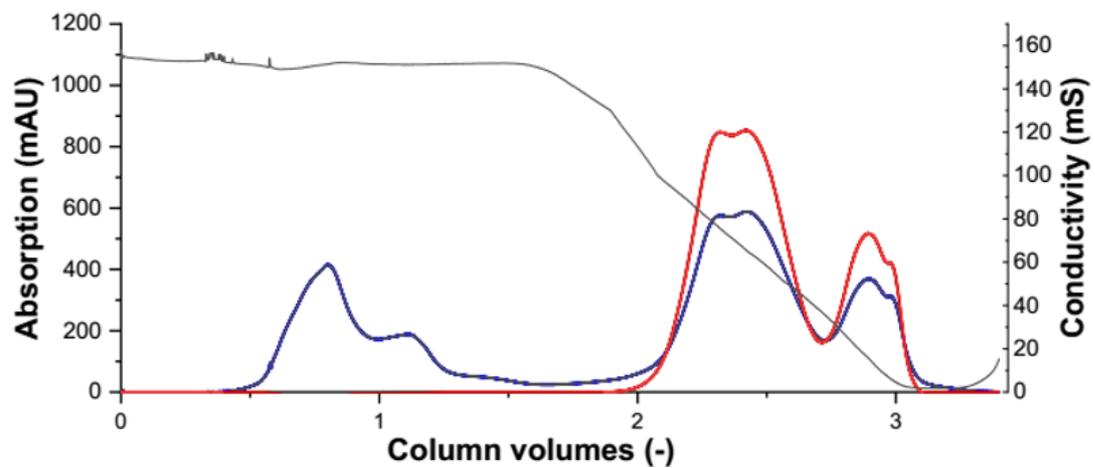

(b) *rCabUPO2*

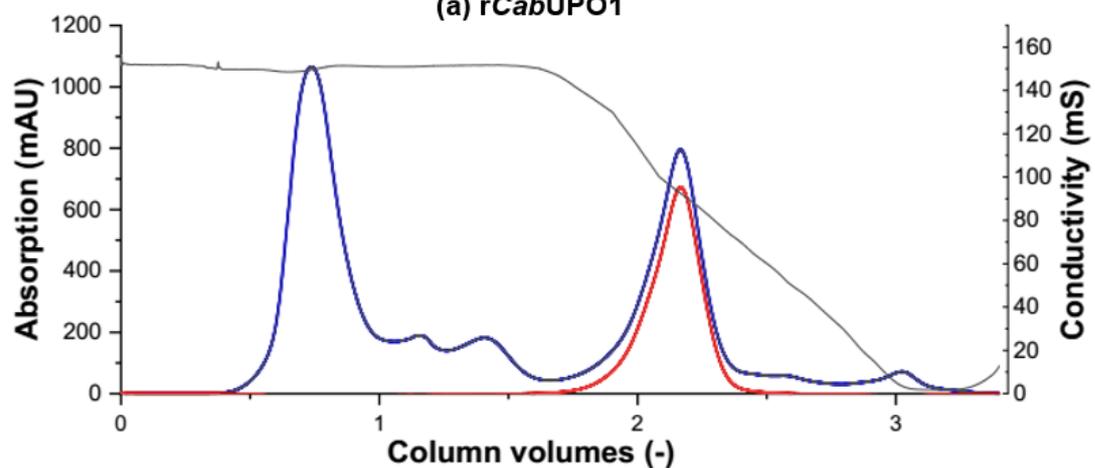

(c) *rAniUPO*

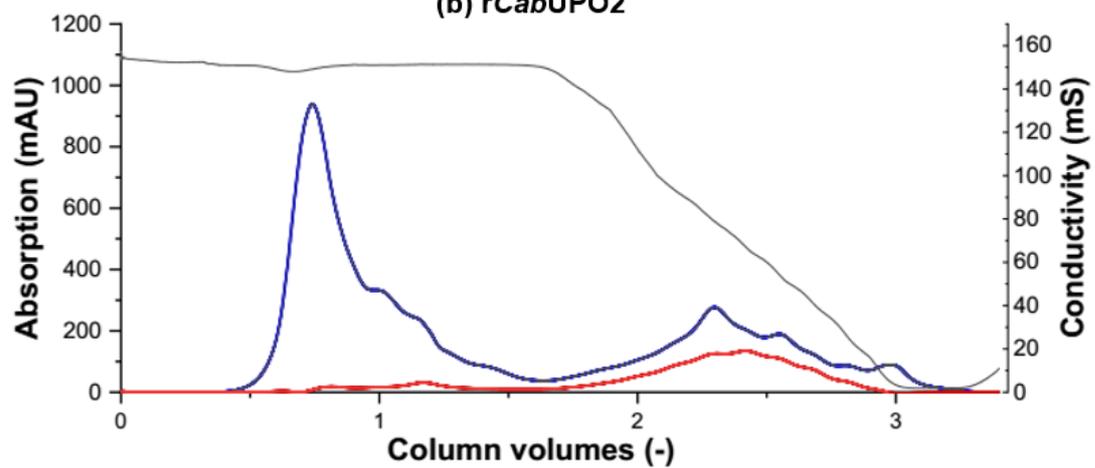

SI Figure S2: Production of recombinant UPOs with *P. pastoris* X33 in a bioreactor. Phases of the glycerol and methanol (fed)-batch process are indicated. A double bar marks the starvation phase preceding the methanol fed-batch. Cultivation was monitored by measurement of OD₆₀₀ (■) and enzyme production by determination of the ABTS activity (■). The drop in OD at 40 h for *rCabUPO1* was the result of losses of culture broth due to overpressure in the reactor. The loss of culture broth was compensated by aseptical addition of fresh medium, which lead to this drop in cell density.

(a) rCabUPO1

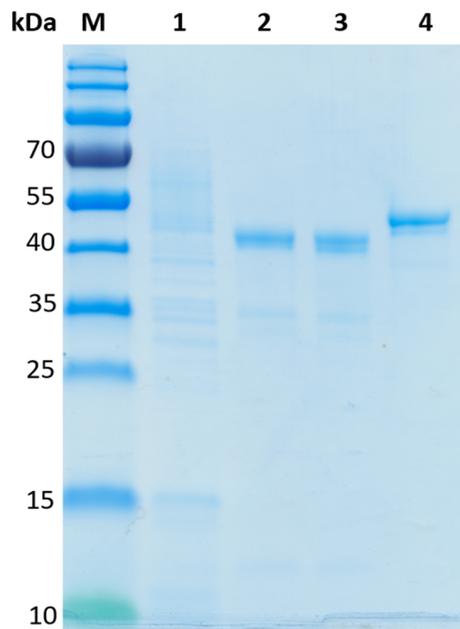

(b) rCabUPO2

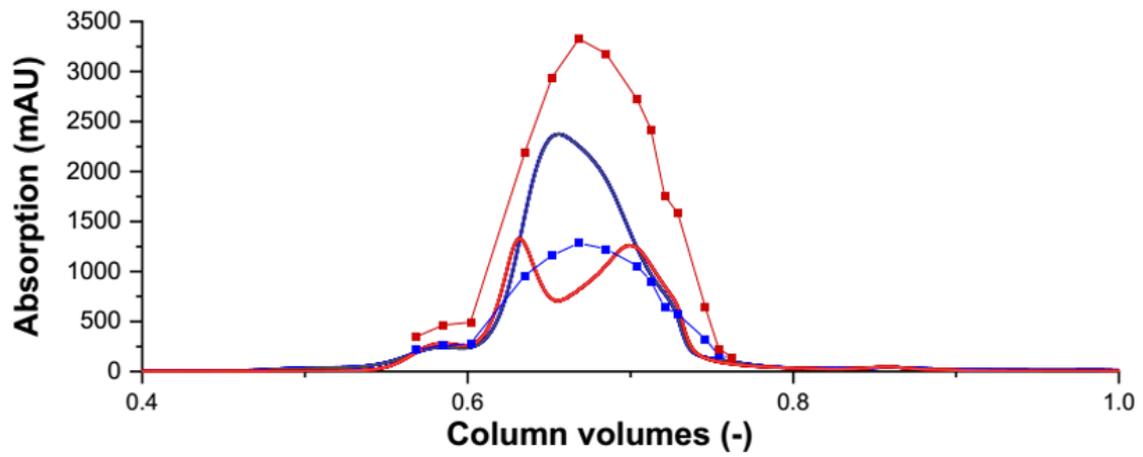

(c) rAniUPO

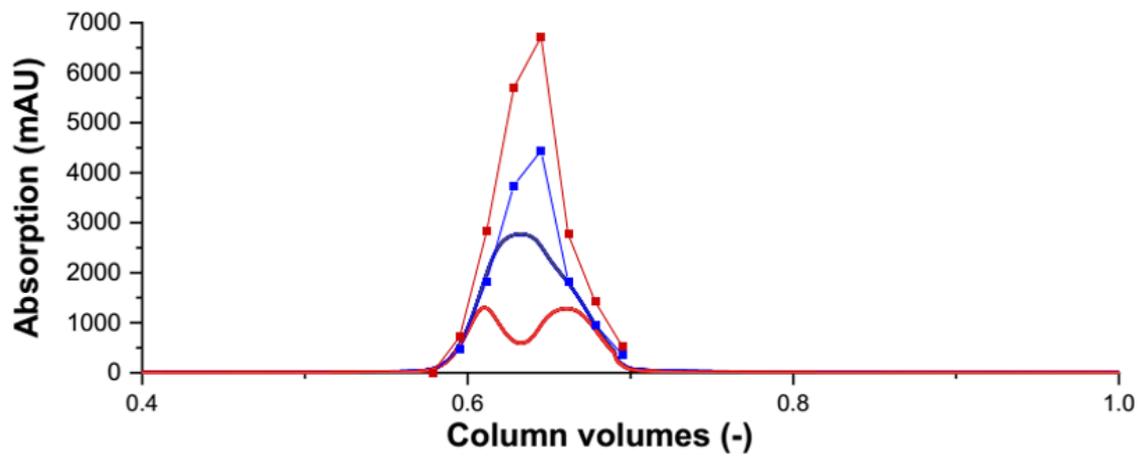

SI Figure S3: Purification of UPOs by hydrophobic interaction chromatography (HIC) using an ammonium sulfate gradient from 1 M to 0 M as indicated by the reduction in conductivity (—). Absorption was determined at 280 nm (—) and heme-specific absorption at 420 nm (—).

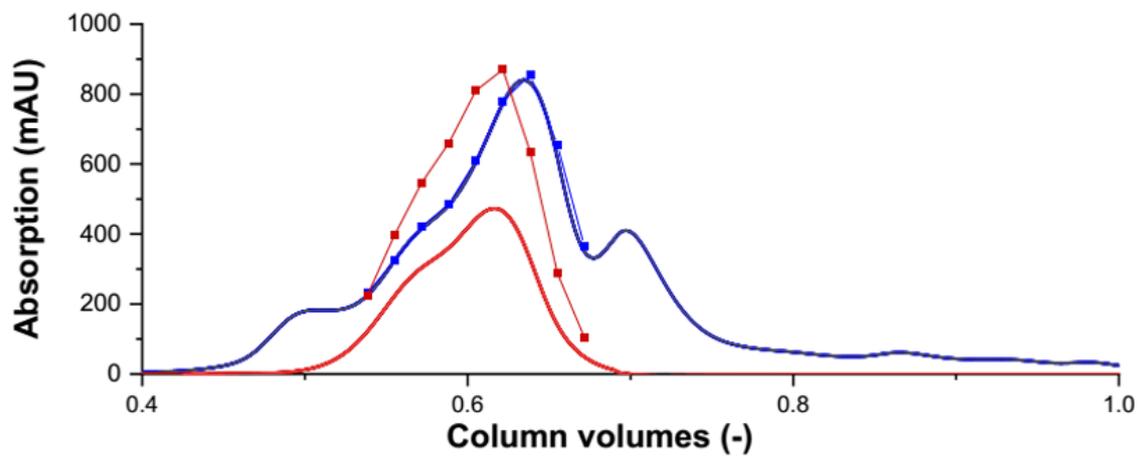

SI Figure S4: SDS-PAGE analysis of pooled fractions after HIC purification. Lanes: **M** PageRuler Prestained (ThermoFisher), **1** rAniUPO, **2** rCabUPO 1 peak 2.4 CV, **3** rCabUPO 1 peak 2.9 CV, **4** rCabUPO 2

(a) rCabUPO1

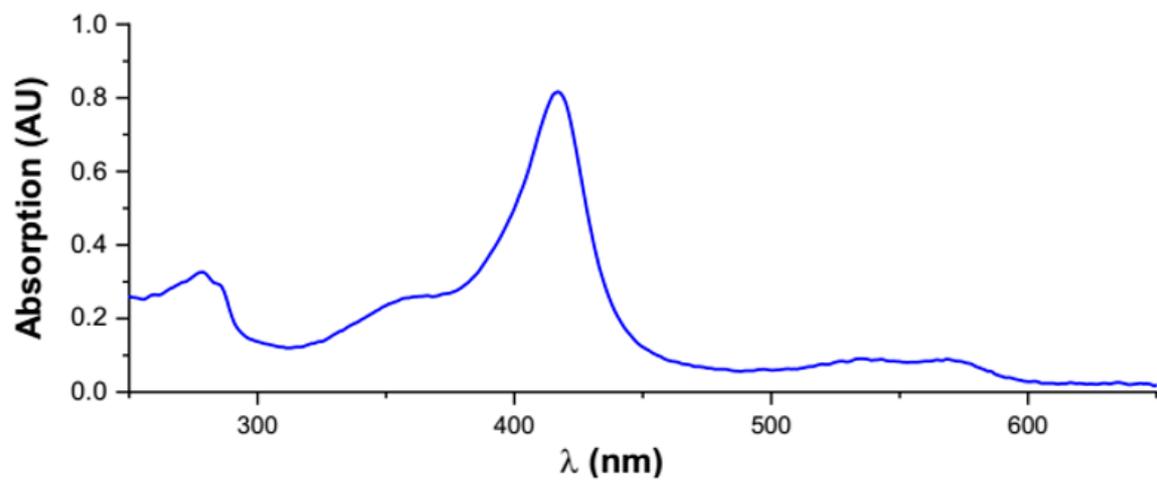

(b) rCabUPO2

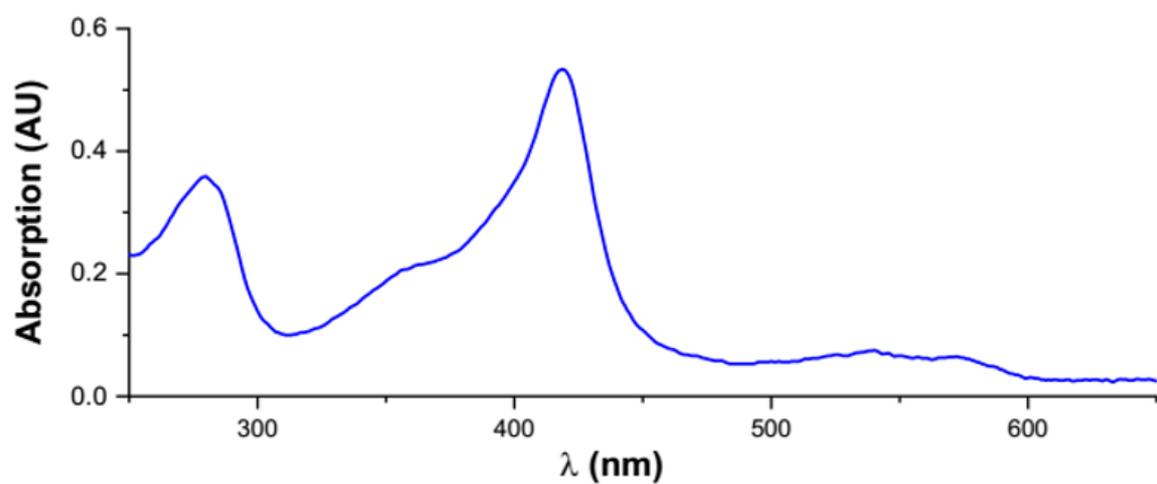

(c) rAniUPO

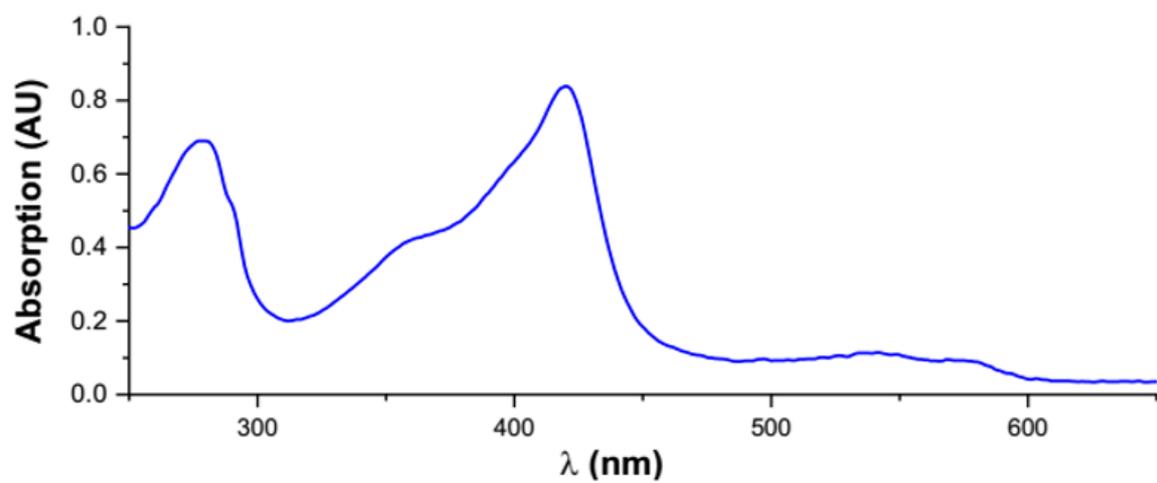

SI Figure S5: Purification of UPOs by size exclusion chromatography. Absorption was determined online (280 nm —, 420 nm —) and offline (280 nm ■, 420 nm ■).

(a) rCabUPO1

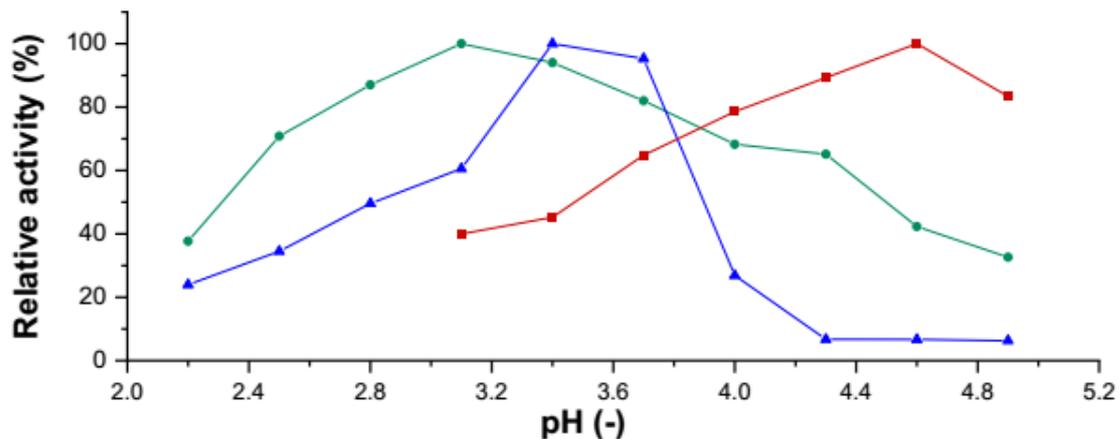

(b) rCabUPO2

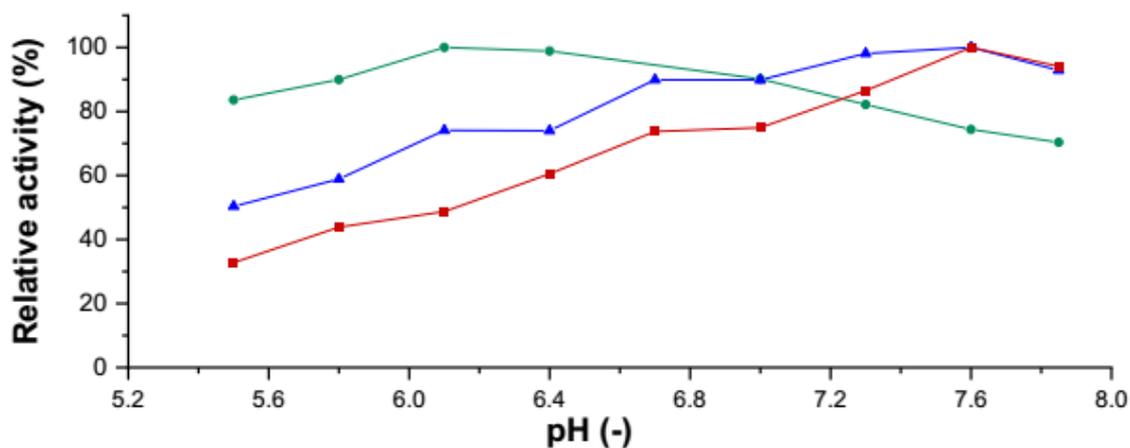

(c) rAniUPO

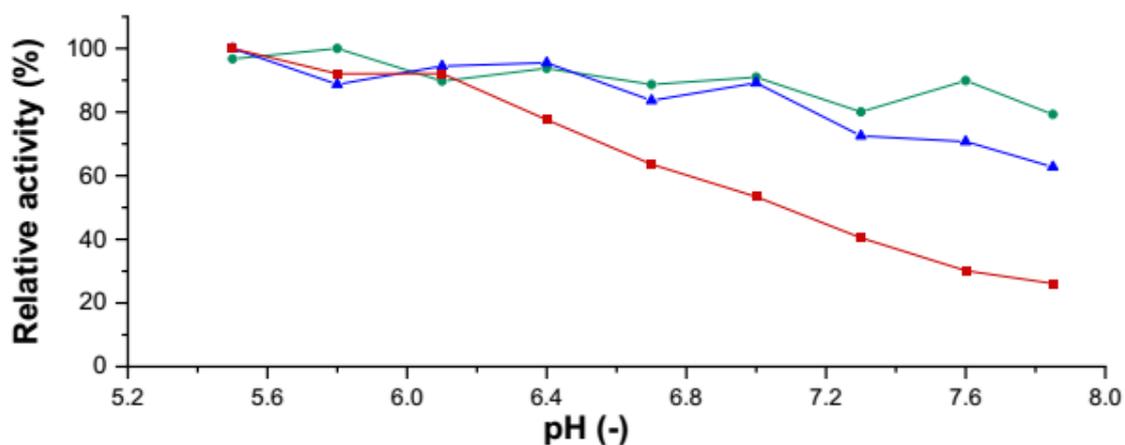

SI Figure S6: Absorption spectra of purified proteins.

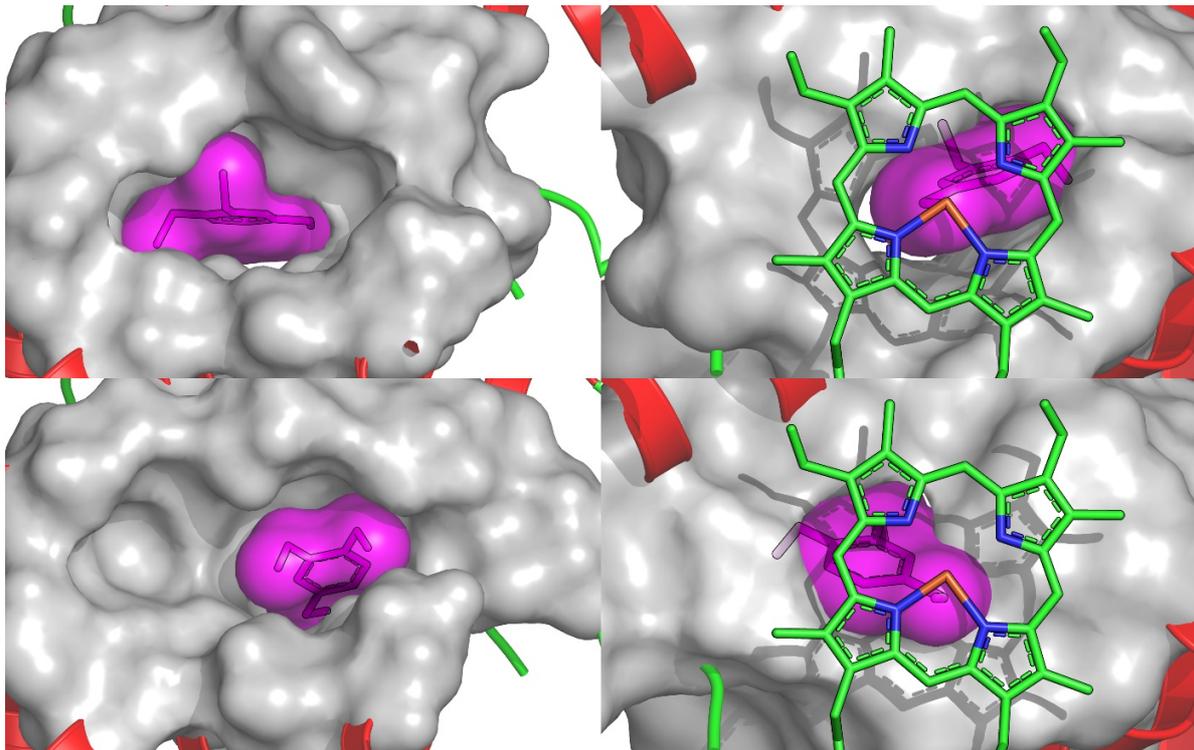

SI Figure S7: Determination of the pH-optimum of r*CabUPO* 1 (▲), r*CabUPO* 2 (■) and r*AniUPO* (●) using ABTS as a substrate. An activity of 100% corresponds to the highest activity measured for each individual enzyme.

SI Figure S8: Determination of the pH-optimum of r*CabUPO* 1 (▲), r*CabUPO* 2 (■) and r*AniUPO* (●) using NBD as a substrate. An activity of 100% corresponds to the highest activity measured for each individual enzyme.

SI Figure S9: Determination of the pH-optimum of r*CabUPO* 1 (▲), r*CabUPO* 2 (■) and r*AniUPO* (●) using veratryl alcohol as a substrate. An activity of 100% corresponds to the highest activity measured for each individual enzyme.

SI Figure S10: VA-dockingsimulation results for *AniUPO* (upper pictures) and *MroUPO* (lower pictures). Each picture on the left is a top-down view from the proteins surface into the substrate access channel. Pictures to the right are the respective bottom-up view. VA in magenta as sticks surrounded by its approximated SES. Heme as sticks; carbon = green, nitrogen = blue, iron = brown.

SI Table S1: Primers used for the construction of pPpB1-based UPO expression plasmids.
