

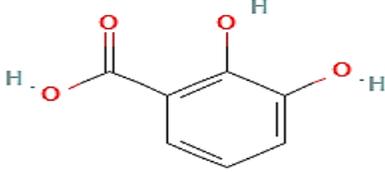

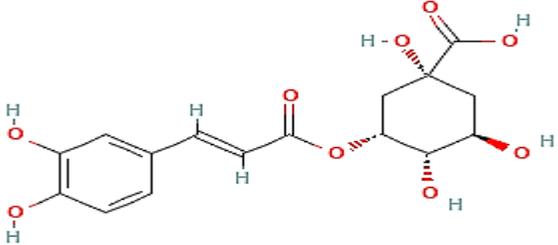

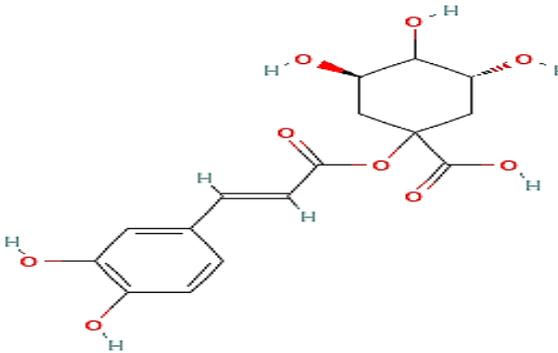

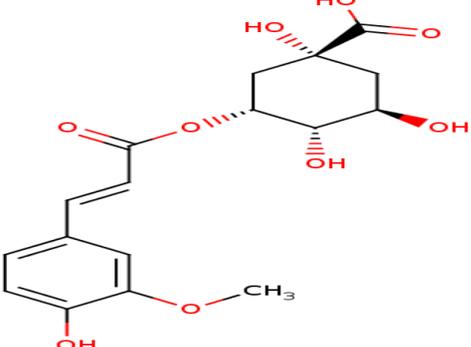

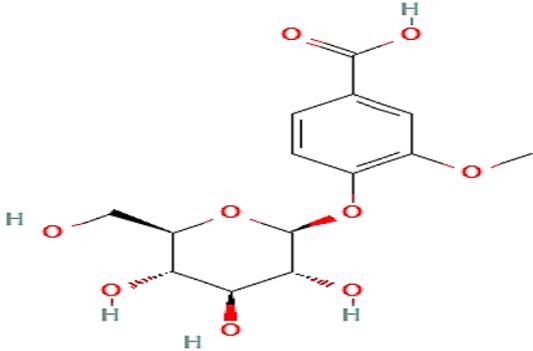

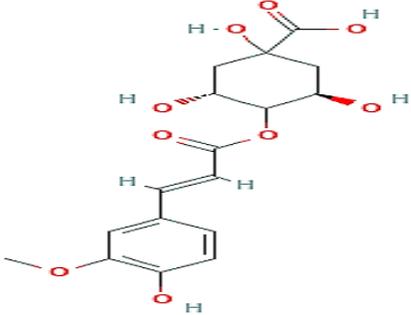

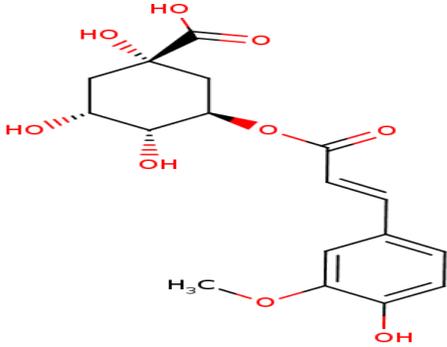

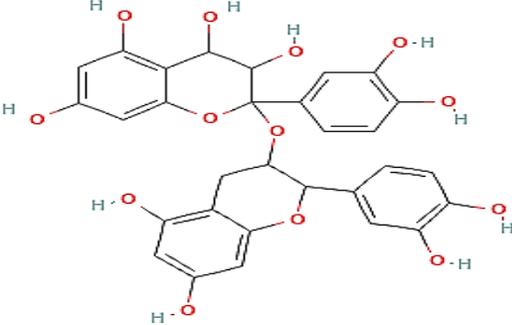

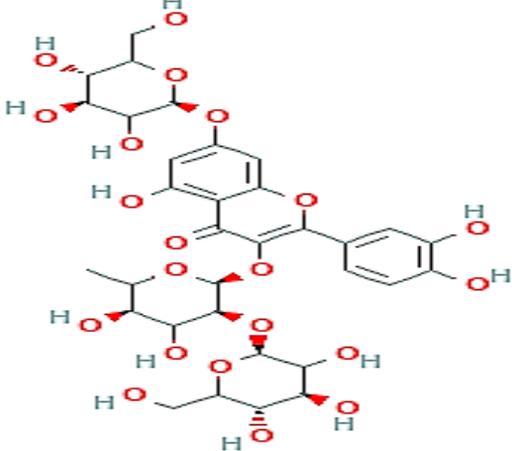

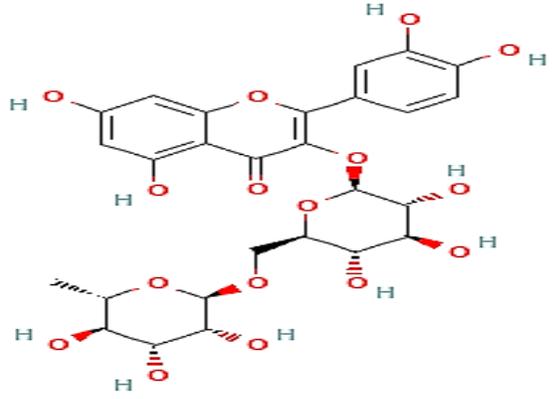

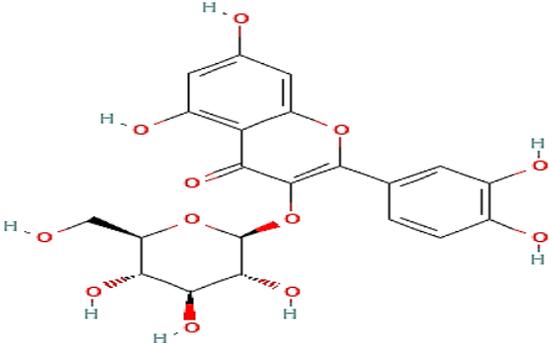

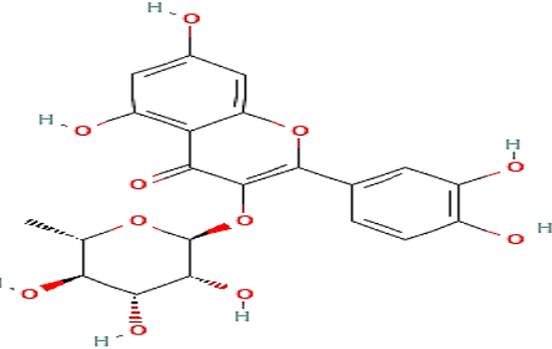

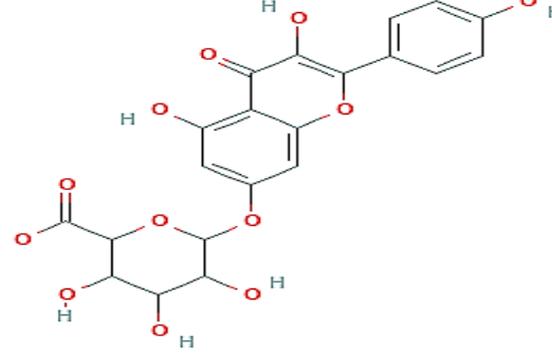

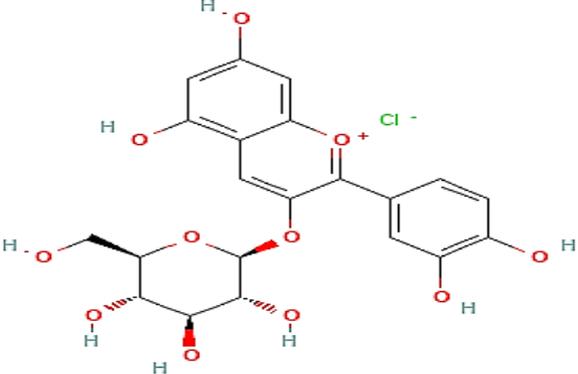

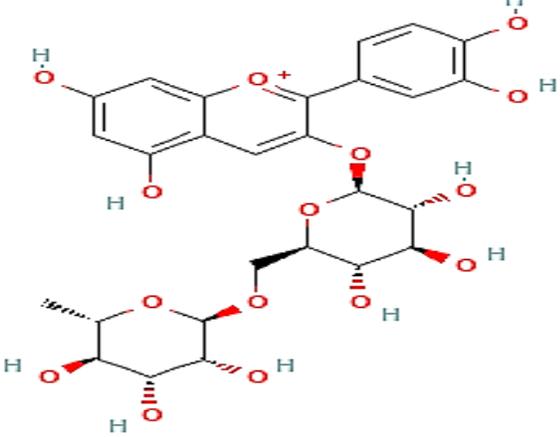

Figure S1. HPLC-DAD-MS (ESI⁺) chromatogram specific to the phenolic profile for black mulberry fruit at two wavelengths (280 nm and 340 nm)

Table S1. Chemical structures of tentative compounds identified in black mulberry fruit by HPLC-DAD-MS (ESI+).
Source: PubChem (nih.gov) and phenol-explorer.eu.

Class	Compounds/ CID	Chemical structures
Phenolic acids	Dihydroxybenzoic acid CID: 19	
	5-Caffeoylquinic acid (Chlorogenic acid) CID: 5280633	
	1-Caffeoylquinic acid CID: 10155076	
	3-Feruloylquinic acid CID: 5317346	
	Vanillic acid-glucoside CID: 14132336	

	<p>4-Feruloylquinic acid CID: 10177048</p>	 <p>The structure shows a central cyclohexane ring with a carboxylic acid group at the top position. Two hydroxyl groups are attached to the ring at the 2 and 5 positions. An ether linkage connects the 3 position of the ring to the 4 position of a feruloyl group, which consists of a propenoic acid chain attached to a 4-methoxyphenyl ring.</p>
	<p>5-Feruloylquinic acid CID: not available</p>	 <p>The structure shows a central cyclohexane ring with a carboxylic acid group at the top position. Three hydroxyl groups are attached to the ring at the 2, 3, and 4 positions. An ether linkage connects the 5 position of the ring to the 4 position of a feruloyl group, which consists of a propenoic acid chain attached to a 4-methoxyphenyl ring.</p>
	<p>Procyanidin dimer CID: 107876</p>	 <p>The structure shows two flavan-3-ol units linked together via a C4-C8 ether bond. Each unit consists of a benzopyrylium ring system with multiple hydroxyl groups attached to the aromatic rings.</p>
	<p>Quercetin 3-glucosyl-(1->2)- rhamnoside-7-glucoside CID: 44259290</p>	 <p>The structure shows a quercetin aglycone core with three sugar units attached. A glucose unit is attached to the 3-position of the quercetin core, a rhamnose unit is attached to the 1-position of the glucose unit, and another glucose unit is attached to the 7-position of the quercetin core.</p>

Flavonoids	<p>Quercetin 3-O-rutinoside CID: 5280805</p>	 <p>The structure shows a quercetin aglycone (a flavon-3-ol with hydroxyl groups at positions 2, 3, 5, and 7) linked via an oxygen atom at the 3-position to the C-1 of a rutinoside sugar. The rutinoside is a disaccharide composed of a glucose unit and a rhamnose unit, both in their cyclic pyranose forms.</p>
	<p>Quercetin 3-O-glucoside CID: 5280804</p>	 <p>The structure shows a quercetin aglycone linked via an oxygen atom at the 3-position to the C-1 of a glucose unit in its cyclic pyranose form.</p>
	<p>Quercetin 3-O-rhamnoside CID: 5280459</p>	 <p>The structure shows a quercetin aglycone linked via an oxygen atom at the 3-position to the C-1 of a rhamnose unit in its cyclic pyranose form.</p>
	<p>Kaempferol 3-O-glucuronide CID: 5318759</p>	 <p>The structure shows a kaempferol aglycone (a flavon-3-ol with hydroxyl groups at positions 5 and 7) linked via an oxygen atom at the 3-position to the C-1 of a glucuronide unit. The glucuronide is a six-membered ring with a carboxylic acid group at the C-5 position.</p>

	<p>Cyanidin 3-O-glucoside CID: 197081</p>	 <p>The structure shows a cyanidin cation (a flavylium ion) with a glucose molecule attached to the 3-position of the flavylium ring. The glucose is in its cyclic pyranose form. A chloride ion (Cl⁻) is shown as a counterion. The flavylium ring has hydroxyl groups at positions 5 and 7, and a hydroxyl group at position 4. The glucose has hydroxyl groups at positions 2, 3, and 6.</p>
<p>Anthocyanins</p>	<p>Cyanidin 3-O-rutinoside CID: 441674</p>	 <p>The structure shows a cyanidin cation with a rutinoside molecule attached to the 3-position of the flavylium ring. The rutinoside is a disaccharide composed of glucose and fructose. The flavylium ring has hydroxyl groups at positions 5 and 7, and a hydroxyl group at position 4. The glucose part of the rutinoside has hydroxyl groups at positions 2, 3, and 6. The fructose part has hydroxyl groups at positions 2 and 6.</p>
