

Supporting Information Supplement Figure S1:

SF1. In-vitro degradation by size measurements via alizarin red staining of whole scaffold at day 1 and day 21 (n=3). Aperio ImageScope were used to determine the bilateral diameter of the whole scaffold.

Supplement Figure S2:

SF2. In-vitro degradation by size following 21 days culture period obtained via histological staining of whole scaffold (SF1 above) at day 1 and day 21 (n=3), * = statistical significance via two-way ANOVA multiple comparisons between each scaffold with its former day point.
