Figure S1. Wave motion bioreactor for hMSC aggregate formation. From reference: [1, 2].

Figure S2. Effect of coating on microchannel on aggregate formation. **(A)** The microchannel dimension and the existence of aggregate adhesion in the channel; **(B)** The effect of bovine serum albumin (BSA) coating in the microchannel with round bottom and the flat bottom. Scale bar: 200 μ m.

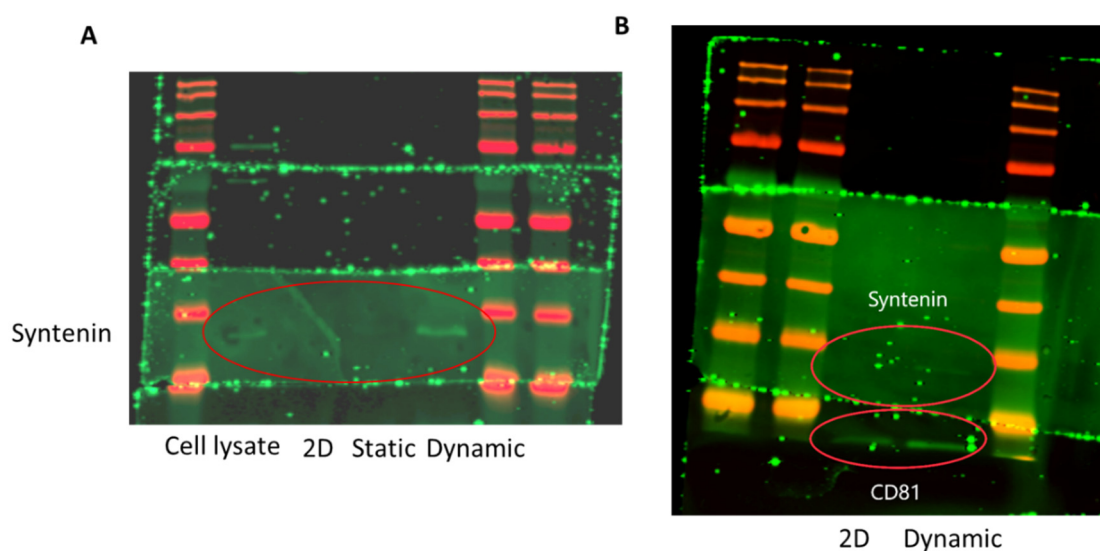

Figure S3. Western blot for exosomal markers for the isolated EVs. **(A)** and **(B)** are two different runs for different samples.

Figure S4. hMSC aggregation affected by cytoskeleton organization. Different inhibitors were added to the hMSCs (seeded at 5000 cells per well of low attachment 96-well plate) at day 0. Images were taken at day 1 and 4. Cytochalasin D (cytoD), Y-27632 (ROCKi), and nocodazole (Noco) were added into culture media at final concentrations of 0.2 μ M, 10 μ M, and 1.0 μ M, respectively. Scale bar: 100 μ m.

Table S1. Donor information of bone marrow derived hMSCs.
