

Supplement S1

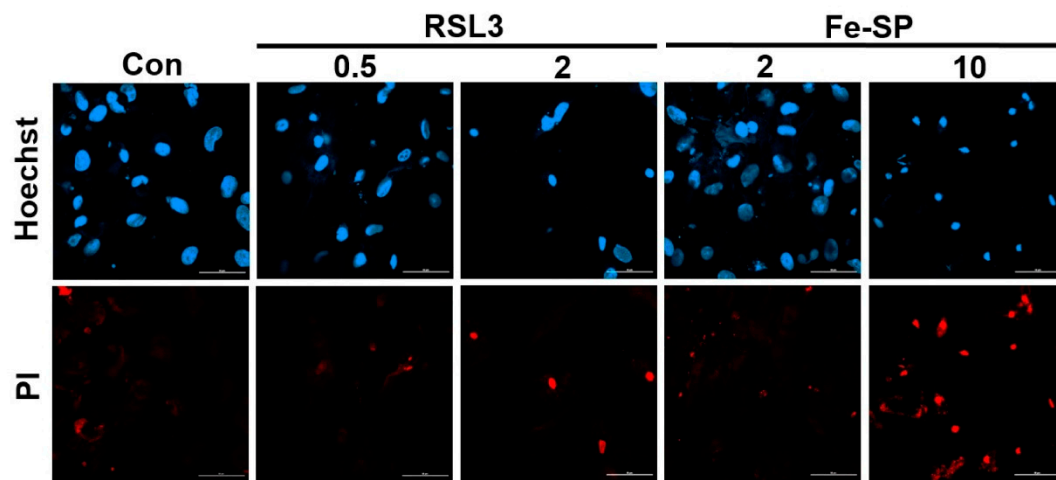

Figure S1. Treatment with RSL3 and Fe-SP in neonatal rat cardiomyocyte for 24 h, and examined through confocal microscopy using Hoechst 33342 and PI stainings. The results showed that RSL3 (2 μ M) and Fe-SP (10 μ M) treatments increased the number of PI positive cells, but not at low concentrations of RSL3 (0.5 μ M) and Fe-SP (2 μ M) in neonatal rat cardiomyocytes.
