Supplementary figure

A Fresh adipose stem cell isolation

B Fresh oogonial stem cell isolation

Supplementary Figure S1. FACS plots for fresh adipose stem cell isolation and fresh oogonial stem cell isolation. **A.** Fresh adipose stem cells were sorted by using FACS. The adipose cell was stained with isotype antibodies or target antibodies (CD105 & CD29) and propidium iodide (PI). ASC population was gated according to the isotype control staining in the PI negative population. **B.** Fresh oogonial stem cells (OSC) were sorted by using DDX4 antibody and isotype control antibody. OSC population was gated according to isotype control staining in PI negative cells.
