

Figure S1. Data of the hypothetical patient in a double logarithmic diagram in case of normal- and increased serum values as well as with- or without intrathecal FLC κ synthesis. Patient A/B: CSF serum quotient of normal and increased serum and CSF values (table 1.1 Patient 1-A, Patient 1-B). Patient C: Increased serum values and intrathecal synthesis of FLC κ . Patient D: normal serum values with intrathecal FLC κ synthesis. FLC κ free light chains kappa, Q quotient, Alb albumin
