

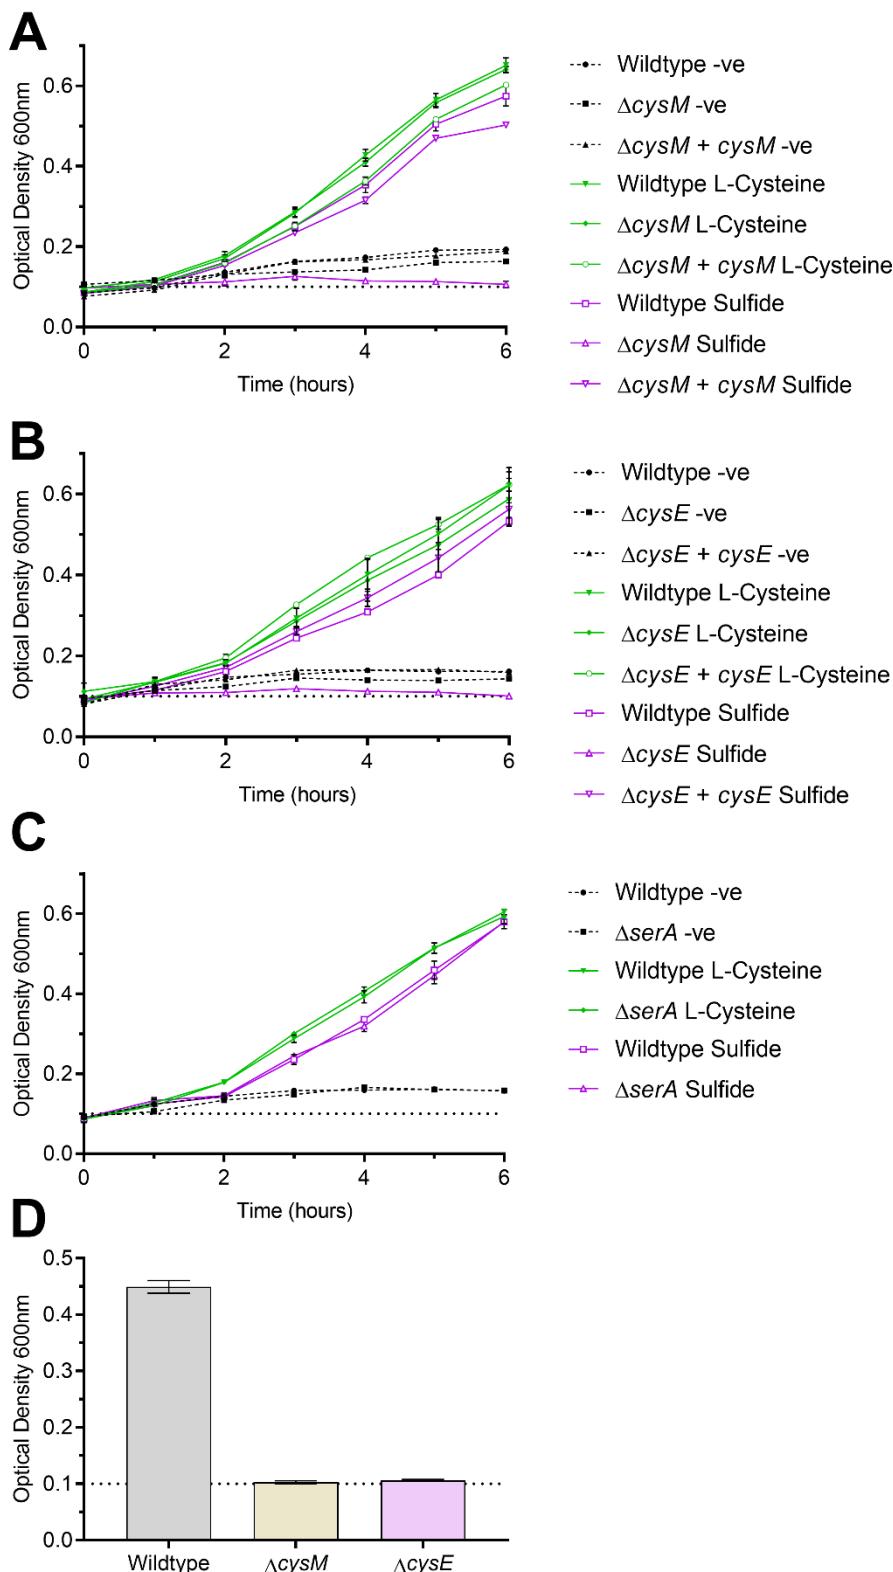

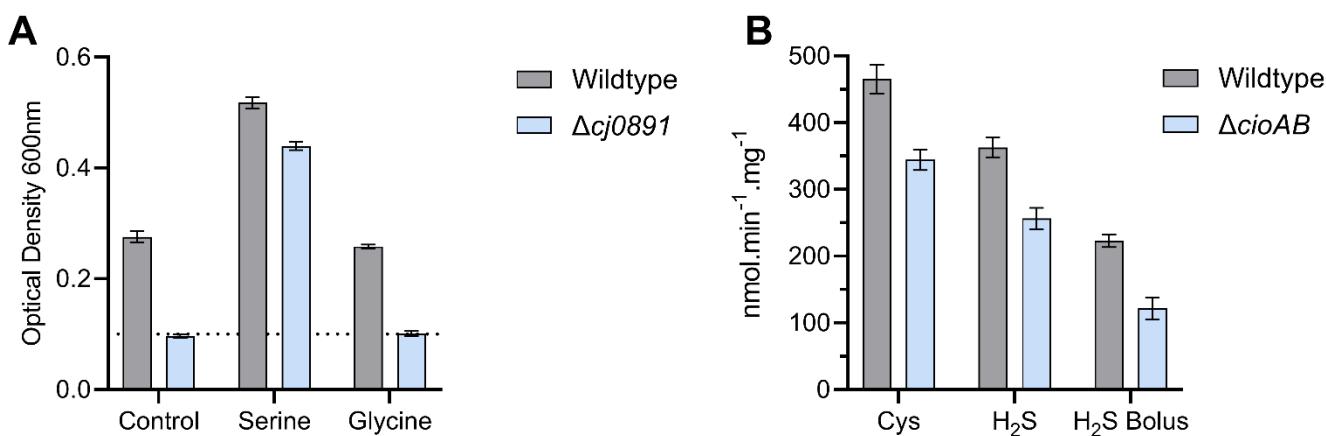

**Figure S1.** (A) SDS-PAGE showing nickel affinity purified CysM protein. CFE: cell free extract; FT: Ni-column flow through; 21-28: Ni-column elution fractions; CysM: Buffer exchanged purified CysM protein. (B) Degradation of the aminoacrylate intermediate of purified CysM in the absence of sulfur acceptor is dependent on the concentration of sulfur acceptor and indicates spontaneous turnover. (C) Standard curve of cysteine used in the acid ninhydrin assays.

**Figure S2.** Full growth curves in sulfur deficient defined media with either no addition (-), cysteine or sulfide added, for wildtype and (A)  $\Delta cysM$  and genetically complemented strain, (B)  $\Delta cysE$  and genetically complemented strain and (C)  $\Delta serA$ . (D) Growth of wildtype,  $\Delta cysM$  and  $\Delta cysE$  with thiosulfate as sole sulfur source, displayed as the optical density reached after 6 h. In all panels, the inoculum level is indicated by the dashed line.

**Figure S3.** (A) Growth of *C. jejuni* NCTC11168 wildtype and *serA* (*cj0891*) mutant on L-Serine minus defined media with the addition of either L-Serine or glycine (10 mM final), displayed as the optical density at 600nm achieved after 6 h. Dotted line indicates the inoculum level. (B) Total oxidase specific activity, calculated in nmol oxygen consumed, per minute, per mg of total protein (see Figure 7).
