Results are shown as the molar percentage of total metabolites. Median  $\pm$  interquartile range (25 – 75) was calculated, and statistical significance was assessed with Wilcoxon rank-sum test and false-discovery rate (FDR q<0.05) correction by the Benjamini-Hochberg method. SAH, s-adenosylhomocysteine; SAM, s-adenosylmethionine; THF, tetrahydrofolate; TMAO, trimethylamine N-oxide.

Results are shown as the internal standard/mmol creatinine percentage of total metabolite. Median ± interquartile range (25 – 75) was calculated, and statistical significance was assessed with Wilcoxon rank-sum test and false-discovery rate (FDR q<0.05) correction by the Benjamini-Hochberg method.
