Supplemental Figure S1

Title: Comparison of standard lipids between β -quantification and NMR (Bland Altman plots)

(dashed line = limits of agreement, continuous horizontal line = mean difference; C= cholesterol. HDL= high density lipoproteins. LDL= low density lipoproteins. TC= total cholesterol. TG= triglycerides)

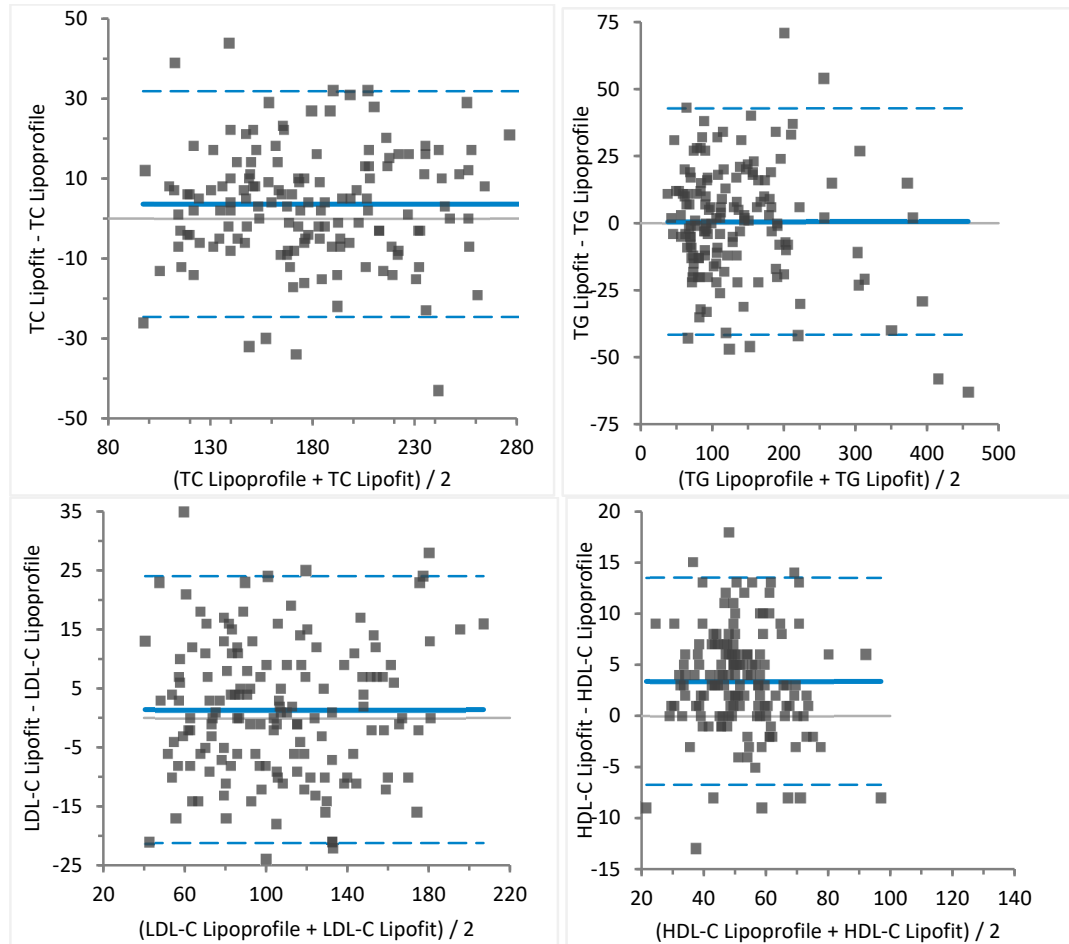

Supplemental Figure S2

Title: Comparison of lipoprotein particles between the lipoprofile and lipofit methods (Bland Altman plots)

(dashed line = limits of agreement, continuous horizontal line = mean difference; HDL= high density lipoproteins. LDL= low density lipoproteins. p= particles. VLDL= very low density lipoproteins)

Supplemental Figure S3

Title: Comparison of standard lipids between the lipoprofile and lipofit methods

The figures show the Passing-Bablok regression for total cholesterol (top left), triglycerides (top right), low density lipoprotein cholesterol (bottom left), and high density lipoprotein cholesterol (bottom right). The respective slopes of the regression lines (red) were 1.026 (TC), 0.988 (TG), 1.000 (LDL-C), and 0.958 (HDL-C), respectively. The grey line represents the line of identity.

(C= cholesterol. HDL= high density lipoproteins. LDL= low density lipoproteins. TC= total cholesterol. TG= triglycerides)
