

Supplementary Figure S1. Comparison of renal polyamine levels in control and RLDC-treated Wt, *Smox*-KO and *Sat1*-KO mice. Renal polyamine levels were compared on day 35 after the final saline (Veh) or cisplatin (RLDC) treatment. The (**) denotes a $p < 0.01$ when average values of Vehicle and RLDC *Smox*-KO samples were compared. The (++) denotes a $p < 0.01$ when average values of Vehicle controls of WT and *Smox*-KO samples were compared. The (#) denotes $p < 0.01$ when average values of WT and *Smox*-KO mice subjected to RLDC were compared.
