Test used:	Wilcoxon	Mann-Whitney			Wilcoxon	Mann-Whitney		

Figure S1. Graph of emitted USV (A), heart rate (HR) (B) and freezing levels (C) of rats before conditioning (A, B, dots in C; with medians); and test freezing levels to context (5 min, squares) and context with cue (light; averaged three 20-s long exposures, triangles). Arrows in A show two copiously vocalizing rats which were not included in the final analysis. (D) Table of the values graphed and group effects (Kruskal-Wallis). (E) Table of statistical comparisons of freezing between preconditional (pre) values and test values (Wilcoxon) as well as test values between groups (Mann-Whitney), with p < 0.05 values in bold.

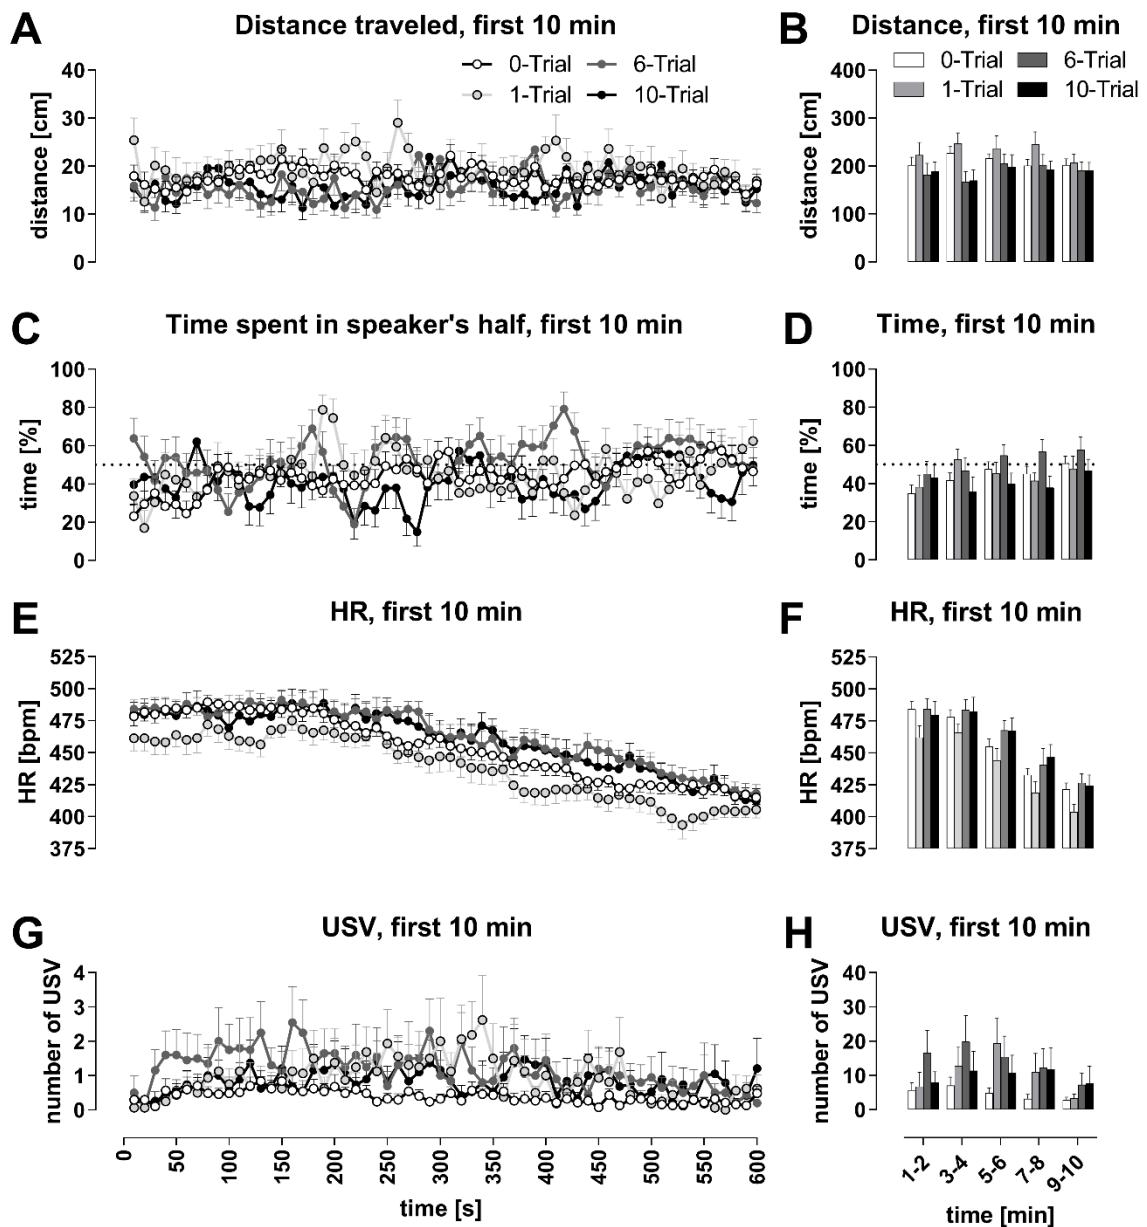

Figure S2. Assessment of locomotor activity, heart rate (HR) and the number of USV emitted of all animals during the first 10 min of silence in the experimental cage; (A, B) distance traveled (cm); (C, D) time (%) spent in a speaker's half of the cage with horizontal dotted line marking 50% chance level; results above it show more time in the speaker's half; (E, F) heart rate (bpm); (G, H) number of USV. Values are means with SEM. HR, initially stable, declined progressively in all four groups; however, HR in 1-Trial group was lower than in groups with zero, six and ten shocks. Mean values with SEM are presented for 10-s intervals in line graphs (A, C, E, G) and 2-min intervals in bar graphs (B, D, F, H); groups: 0-Trial, n = 37; 1-Trial, n = 16; 6-Trial, n = 20; 10-Trial, n = 19.

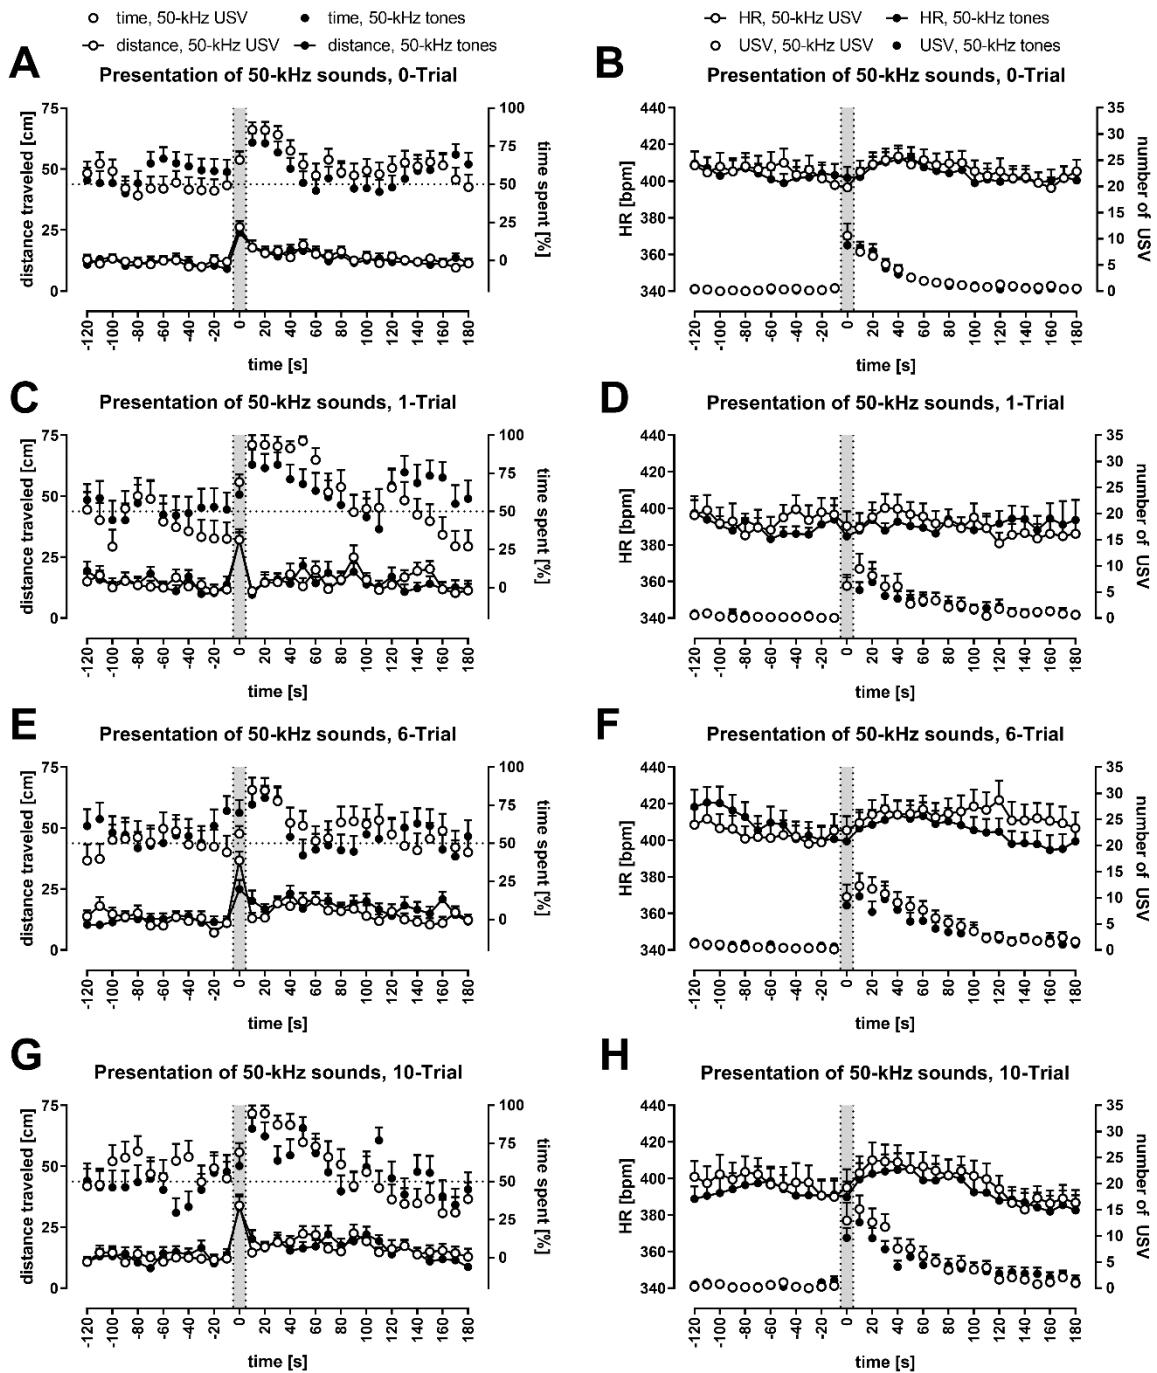

Figure S3. Effect of 50-kHz ultrasonic playback sounds on distance traveled, time spent in the speaker's half of the cage, heart rate (HR) and USV emission. Gray sections correspond to the 10-s-long ultrasonic presentation. Graphs depict responses after previous exposure to: no shock (**A, B**), one shock (**C, D**), six shocks (**E, F**), and ten shocks (**G, H**). In the left column (**A, C, E, G**), distance traveled is presented as connected dots (cm, left Y axis), percentage of time spent in the speaker's cage half – as not connected dots (%), right Y axis). In the right column (**B, D, F, H**), HR is presented as connected dots (bpm; beats per minute, left Y axis); the number of USV is presented as not connected dots (right Y axis). Each point is a mean for a 10-s-long time-interval with SEM. The dotted horizontal line marks a 50% chance value for time in a side of the cage. HR increased after playback in all groups except 1-Trial rats. There was also a clear USV response to the playback in all groups. The increase in locomotor activity to the playback was more pronounced in fear-conditioned (FC) animals than in 0-Trial rats; groups: 0-Trial, n = 37; 1-Trial, n = 16; 6-Trial, n = 20; 10-Trial, n = 19.

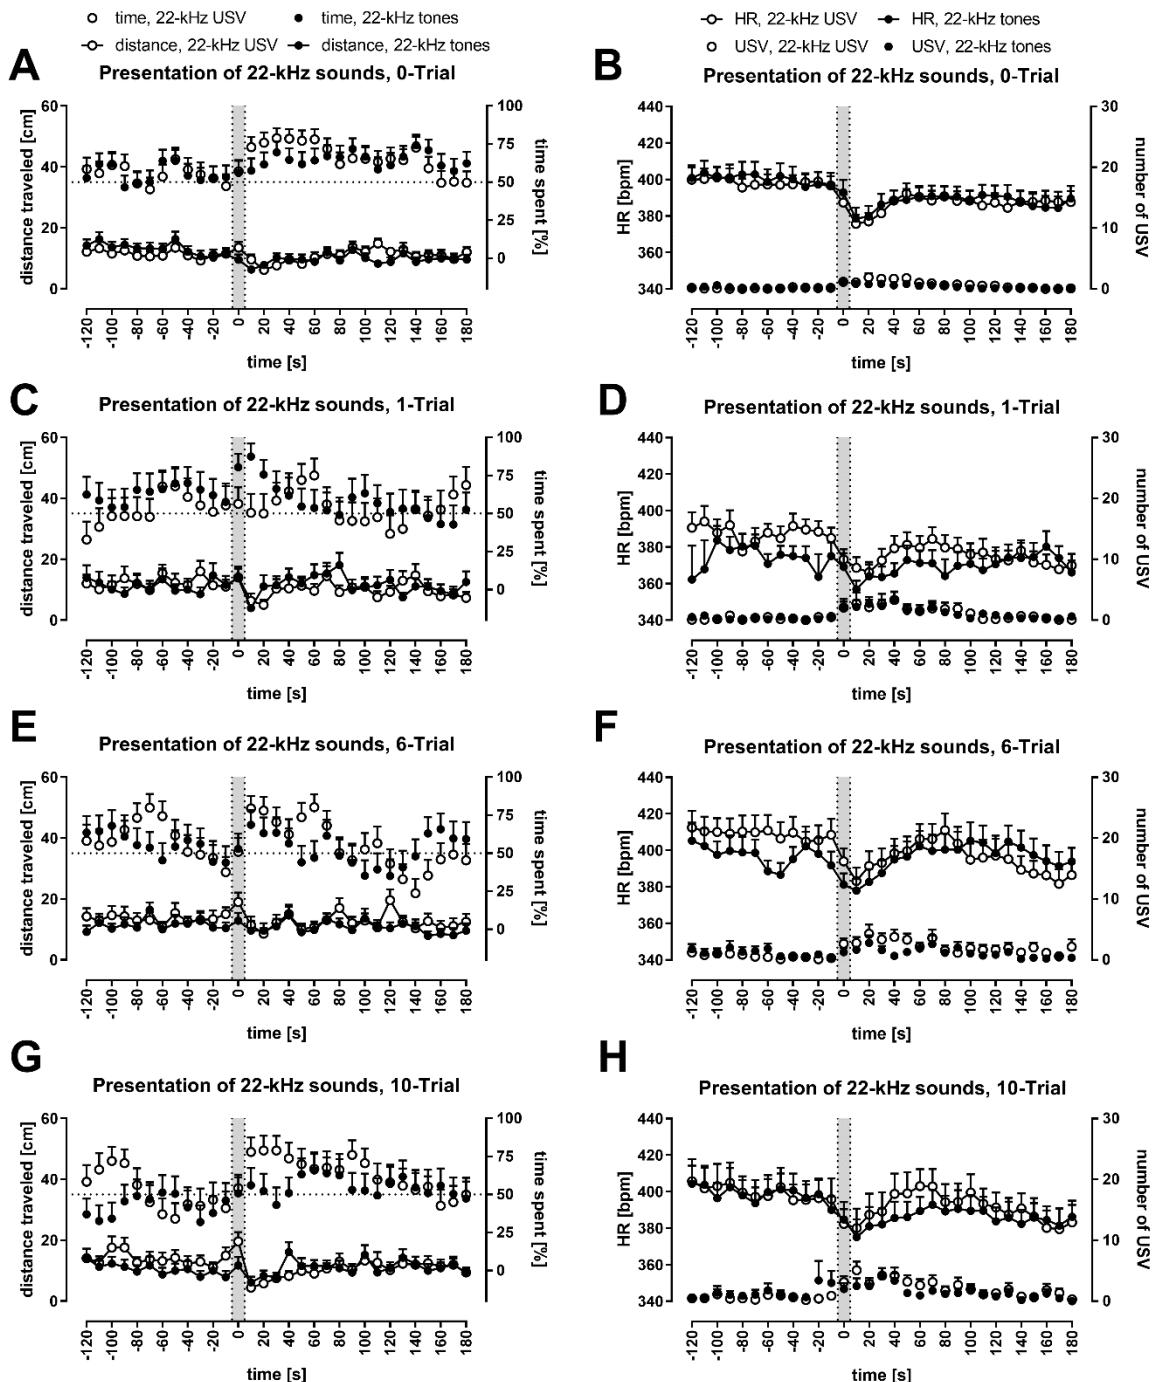

Figure S4. Effect of 22-kHz ultrasonic playback sounds on distance traveled, time spent in the speaker's half of the cage, heart rate (HR) and USV emission. Gray sections correspond to the 10-s-long ultrasonic presentation. Graphs depict responses after previous exposure to: no shock (**A, B**), one shock (**C, D**), six shocks (**E, F**), and ten shocks (**G, H**). In the left column (**A, C, E, G**), distance traveled is presented as connected dots (cm, left Y axis), percentage of time spent in the speaker's cage half – as not connected dots (%; right Y axis). In the right column (**B, D, F, H**), HR is presented as connected dots (bpm; beats per minute, left Y axis); the number of USV is presented as not connected dots (right Y axis). Each point is a mean for a 10-s-long time-interval with SEM. The dotted horizontal line marks a 50% chance value for time in a side of the cage. Playback exposure results in an HR drop in all four groups. There was also a clear USV response to the playback, especially in FC groups. The decrease in locomotor activity after the playback was more pronounced in FC animals than in 0-Trial rats; groups: 0-Trial, n = 37; 1-Trial, n = 16; 6-Trial, n = 20; 10-Trial, n = 19.

Table S4. Evaluation of changes in time spent in the speaker's half **before** (i.e. average time spent from -30 s to -10 s time-intervals) vs. during **playback** (i.e. 0 s time-interval) vs. **after** the playback (i.e. average from 10 s to 30 s time-intervals); significant values (p < 0.05) marked in bold, all Wilcoxon test. Analyzed were the control rats (0-Trial), and rats which underwent fear-conditioning with different number of shocks (1-Trial, 6-Trial, 10-Trial) as well as all the rats together, which one day later were exposed to ultrasonic playbacks (50-kHz USV, 50-kHz tones, 22-kHz USV, 22-kHz tones; with averaged results for USV and tones, i.e. sounds). Please note more instances of significance in case of "sounds" in comparison with USV and tone playbacks.

Table S7. Statistical evaluation of comparisons between the effects of 50-kHz vs. 22-kHz playback of USV, tones, as well as of USV and tones averaged (sounds) presented during 0 s time-intervals on heart rate (HR) – as reported for time-intervals between -120 s and 180 s; significant values ($p < 0.05$) marked in bold, all Wilcoxon test. Analyzed were the control rats (0-Trial), and rats which underwent fear-conditioning the day before – with different number of shocks (1-Trial, 6-Trial, 10-Trial), as well as all the rats together. Please note the onset of significant values to coincide with the time of the playbacks; * – not significant when two outlying rats were included.

Table S10. Evaluation of changes in the **number of USV** around the time of ultrasonic playback, i.e. between **before** (i.e. average time spent from -30 s to -10 s time-intervals) vs. during **playback** (i.e. 0 s time –interval) vs. **after** the playback (i.e. at 10 s time-interval, vs. average from 10 s to 30 s or from 10 s to 120 s time-intervals); significant values ($p < 0.05$) marked in bold, all Wilcoxon test. Analyzed were the control rats (0-Trial), and rats which underwent fear-conditioning with different number of electric shocks (1-Trial, 6-Trial, 10-Trial) as well as all the rats together, which one day later were exposed to ultrasonic playbacks (50-kHz USV, 50-kHz tones, 22-kHz USV, 22-kHz tones; with averaged results for USV and tones, i.e. sounds). Please note the prevalence of significant values in all the groups.

Table S11. Statistical evaluation of comparisons between the effects of **50-kHz vs. 22-kHz playback** of USV, tones, as well as of USV and tones averaged (sounds) presented during 0 s time-intervals **on the number of emitted vocalizations (USV)** – as reported for time-intervals between -120 s and 180 s; significant values ($p < 0.05$) marked in bold, all Wilcoxon test. Analyzed were the control rats (0-Trial), and rats which underwent fear-conditioning the day before – with different number of shocks (1-Trial, 6-Trial, 10-Trial), as well as all the rats together. Please note the onset of significant values to coincide with the onset of the playbacks; NR – the test gave no results; * – not significant when two outlying rats were included.

Table S12. Comparison of **number of USV of different types** and **selected characteristics of 50-kHz USV** emitted during playback sessions, i.e. during the 10-s-long playback and 110 s afterwards, **in response to 50- vs. 22-kHz playback** (USV, tone and sounds) in control (0-Trial, n = 37), fear-conditioned (1-Trial, n = 16; 6-Trial, n = 20; 10-Trial, n = 19; all fear-conditioned/FC'ed), and all rats. MPF – mean peak frequency; categories of USV: 50-kHz (MPF >32 kHz), short 22-kHz (MPF of 18–32 kHz, duration <0.3 s), long 22-kHz (18–32 kHz, >0.3 s); significance levels are given for corresponding 50- vs. 22-kHz sounds, i.e. # p < 0.05, ## p < 0.01, ### p < 0.001, all Wilcoxon test. Please note, duration and MPF of 50-kHz USV were compared only in rats which emitted USV in response to both 50- and 22-kHz playback, n of animals are given. A single USV was eliminated as a long outlier (with > 6 x SD). USV emitted in reaction to 22-kHz playbacks were less numerous, shorter and of lower MPF.

groups	number of USV				parameters of 50-kHz USV		
USV	total USV	50-kHz USV	short 22-kHz USV	long 22-kHz USV	duration [ms]	n	MPF [kHz]

Table S14. Differences in time spent in the speaker's half **in response to USV- vs. tone-playbacks** evaluated during playback (0 s time-interval), after playback (10 s to 30 s, 10 s to 60 s), as well as during the control intervals (from -120 s to -100 s, -30 s to -10 s), in control rats (0-Trial), and rats which underwent fear-conditioning with different number of shocks (1-Trial, 6-Trial, 10-Trial) as well as all the rats analyzed together, all Wilcoxon test, with $p < 0.05$ values in bold. Please note, USV-playback evoked more pronounced approach of the speaker, e.g. in "all rats" group; * – not significant when two outlying rats were included.
