

SUPPLEMENTARY DATA

Salminen et al., A novel two-lipid signature is a strong and independent prognostic factor in ovarian cancer

Supplementary Table S1. Characteristics of the Turku longitudinal patient cohort.

Patient	Stage	Treatment Strategy	Residual Disease	Treatment Response	Progression-free survival (months)	Overall Survival (months)
1	IIIC	PDS	0-1cm	CR	27.2	51.3
2	IIIC	NACT	0cm	CR	2.7	31.4
3	IVA	NACT	0-1cm	CR	19.3	49.7
4	IIIC	NACT	>1cm	CR	3	12
5	IIIC	NACT		PD after NACT	0	14.7
6	IVB	NACT	>1cm	PD	0	18.4
7	IIIB	PDS	0cm	CR	19.6	47.7
8	IIIC	PDS	>1cm	PD	0	7.7
9	IIIC	NACT		PD after NACT	0	19.4
10	IVB	PDS	>1cm	CR	20.1	46.6
11	IVB	PDS	0-1cm	PR	3	36.2
12	IIIC	NACT	0-1cm	CR	3	37.1
13	IIIC	NACT	0cm	PD	0	17.6
14	IVB	NACT	0-1cm	PD	0	10.9
15	IIIC	PDS	0-1cm	CR	19.6	72.9
16	IIIC	NACT	0-1cm	CR	4.5	12
17	IIIC	NACT		PD after NACT	0	12
18	IIIC	PDS	0-1cm	CR	27.7	69.2
19	IIIC	NACT	0-1cm	PR	18.1	43.9
20	IIIC	NACT	0-1cm	CR	5.8	28.2

NACT=neoadjuvant chemotherapy, PDS=primary debulking surgery, PD=progressive disease, CR=complete response, PR=partial response

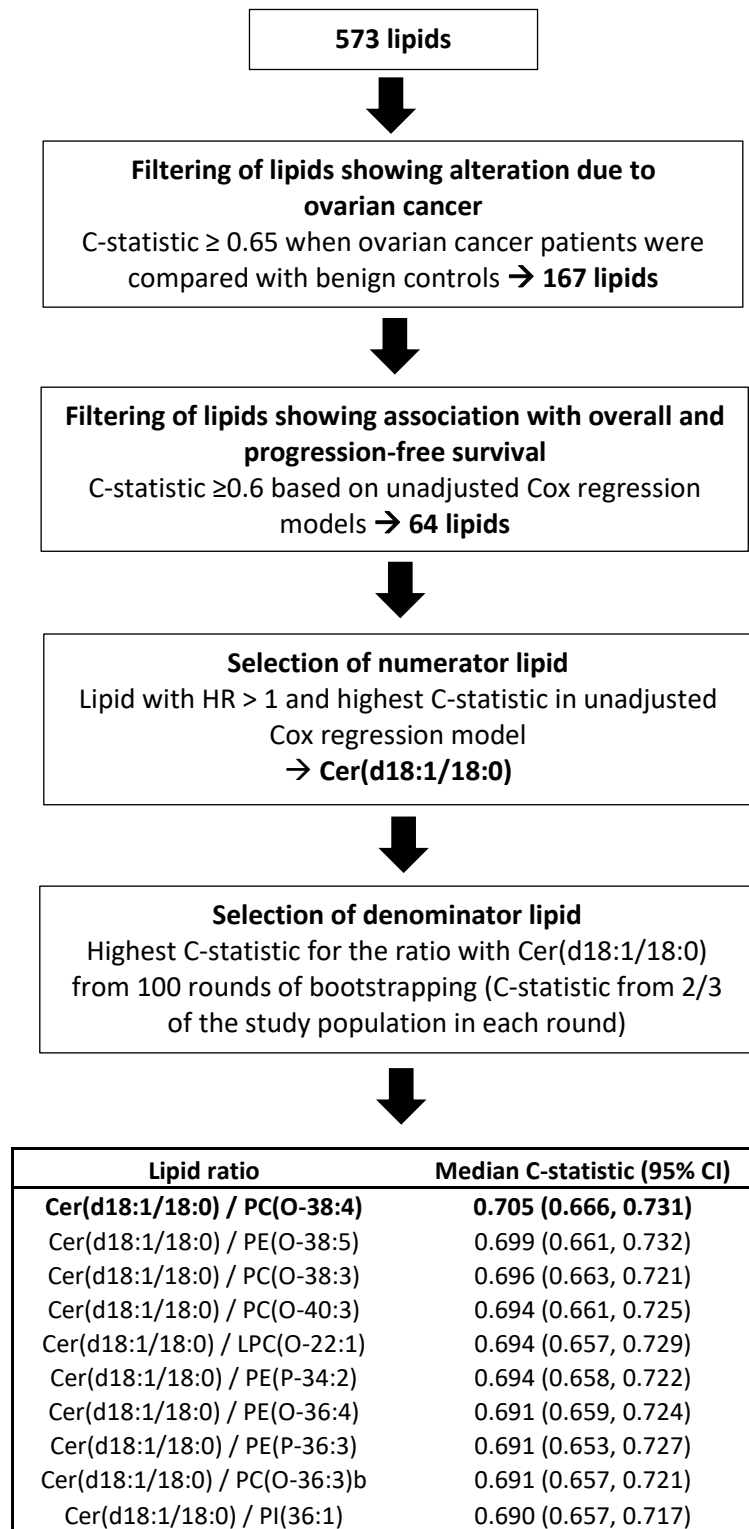

Supplementary Table S3. Prognostic performance of HE4 in the Turku cohort.

	(Sub)group	Ev+	Ev-	HR (95% CI) ^a	C-statistic ^a	HR (95% CI) ^b	C-statistic ^b
Death	All	41	69	1.12 (0.76, 1.66)	0.561	0.72 (0.46, 1.13)	0.702
	No residual tumor	13	42	1.20 (0.59, 2.44)	0.529	0.49 (0.19, 1.26)	0.674
Progression	All	65	45	1.20 (0.86, 1.68)	0.593	0.94 (0.65, 1.37)	0.698
	No residual tumor	22	33	2.07 (1.17, 3.65)	0.659	1.75 (0.86, 3.58)	0.832

Hazard ratios are expressed per increase in standard deviation. Ev+, event; ev-, no event.

^aUnadjusted models.

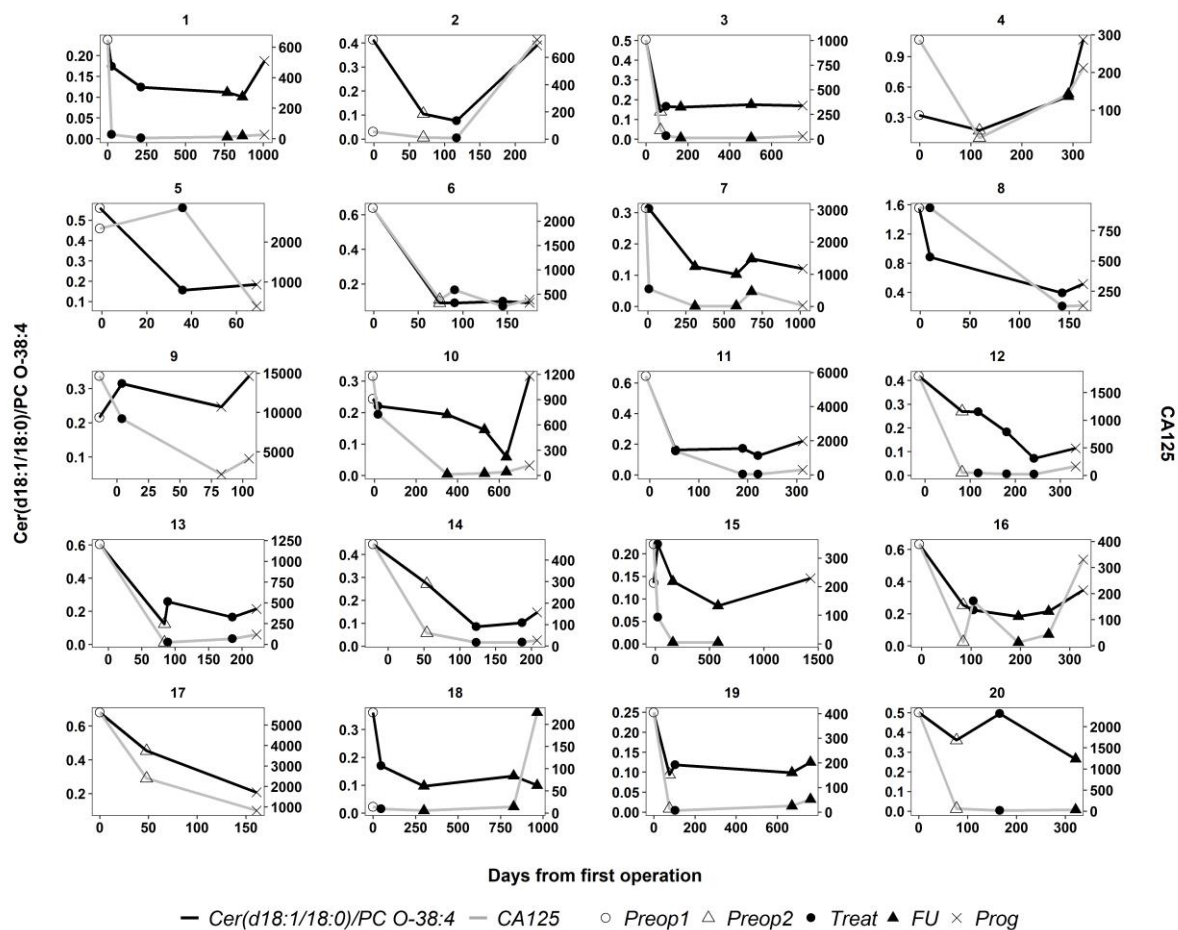

^bAdjusted with age and stage.

Supplementary Figure S1. Selection of the prognostic lipid ratio. First, only ovarian cancer-associated lipids were left for the analyses, whereafter only those were included in the selection that showed association both with overall and progression-free survival. There was only one lipid showing $HR > 1$, i.e. Cer(d18:1/18:0), which was selected as the numerator lipid. Finally, denominator lipid was selected by calculating C-statistic for all the lipids in ratio with the selected numerator lipid. The highest C-statistic was observed for the Cer(d18:1/18:0) / PC(O-38:4) ratio (in the table 10 lipid ratios with the highest C-statistic are shown).

Stage	Residual tumor	PROGRESSION (1 YEAR)			DEATH (5 YEARS)		
III-IV	> 10 mm	21	30	39	46	75	87
	0 - 10 mm	21	29	38	38	66	79
	0 mm	20	29	37	31	57	71
I-II	All	3	4	6	12	21	33
Lipid ratio quartile		Q1-Q2	Q3	Q4	Q1-Q2	Q3	Q4

Supplementary Figure S2. Risk (%) of progression in 1 year or death in 5 years, based on the lipid ratio quartile, stage and success of tumor removal in surgery in the Turku cohort HGSOC patients.

Supplementary Figure S3. Longitudinal analysis of the two-lipid signature and CA-125 in 20 ovarian cancer patients. Patients 18, 19 and 20 did not have samples obtained at progression.
