

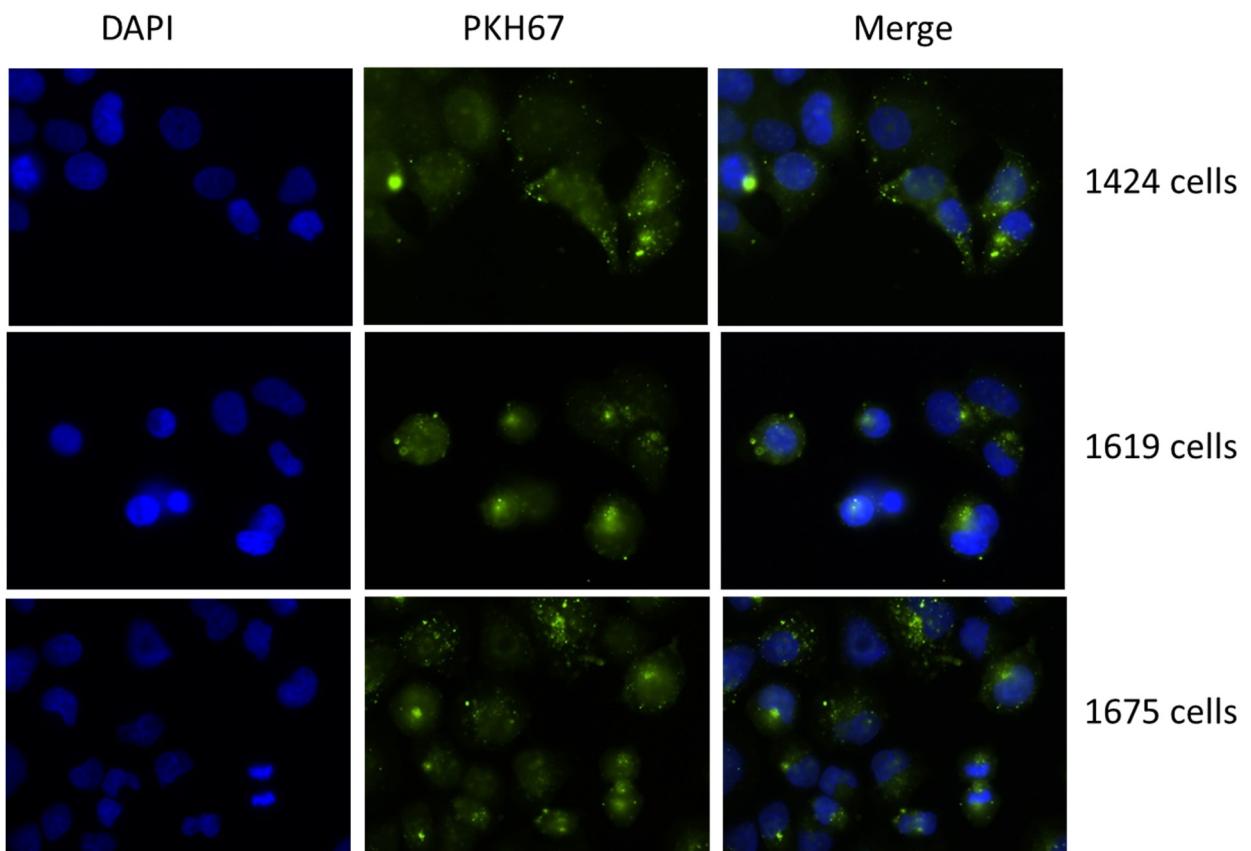

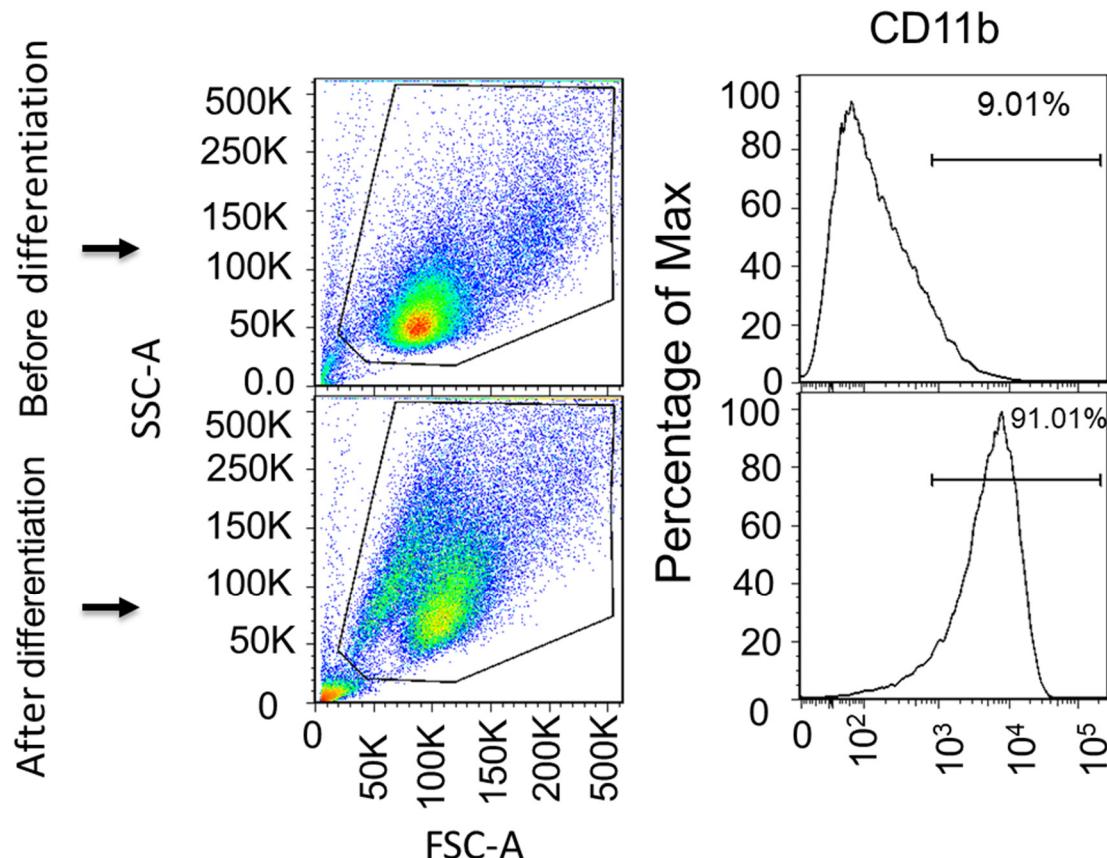

**Figure S1.** Characterization and quantification of plasma derived exosomes from OSA-V1 and OSA-V2 subjects. **(A)** Representative electron microscope image for isolated exosomes, scale bar 100 nm. **(B)** Flow cytometry analyses for exosome surface markers including tetraspanin (CD63) marker in the presence or absence of exosomes were analyzed using a FACS Calibur instrument. Bead flow separation data for exosomes were analyzed using the various capture antibodies followed by Exo-FITC staining, and independent experiments were repeated 4 times. The FITC flow cytometric intensities were then plotted versus the number of exosome particles input into the flow reaction. The data are graphed showing forward scatter versus FITC intensity ( $n=6$ ).

**Figure S2:** Confocal microscope images illustrating exosomes derived from OSA up taken by naïve human melanoma cells. Exosomes from plasma of OSA-V1 and OSA-V2 were labeled with a PKH67-Green Fluorescent Cell Linker Kit. Human melanoma cells were grown on coverslips for 24 h, and the PKH67-labeled exosomes from OSA-V1 and OSA-V2 were added to the melanoma cells at 37°C for 24 h. Cells were washed and stained with nuclei (blue) stained with DAPI. As controls, no exosomes were used but PKH26 was added to the cell medium. Exosome uptake was measured using confocal laser scanning microscopy (LSP5) at 490 nm excitation and 502 nm emission ( $n = 6$ ; scale bar: 10  $\mu$ m).

**Figure S3.** THP-1 cells displayed altered expression of CD11b when monocytes were differentiated into macrophages by PMA as described in the Materials and Methods section. Cells were stained with CD11b antibody and THP-1 cells were quantified by flow cytometry. A representative histogram of three independent experiments is displayed.

**Table S1.** A: List of most significant gene ontology including cellular component involved in 8172 unique target predictions genes found in 46 miRNAs in 1424 cells exposed to IH compared to normoxia.
