

Supplementary Materials: Vitamin D Metabolites in Nonmetastatic High-Risk Prostate Cancer Patients with and without Zoledronic Acid Treatment after Prostatectomy

Carsten Stephan, Bernhard Ralla, Florian Bonn, Max Diesner, Michael Lein and Klaus Jung

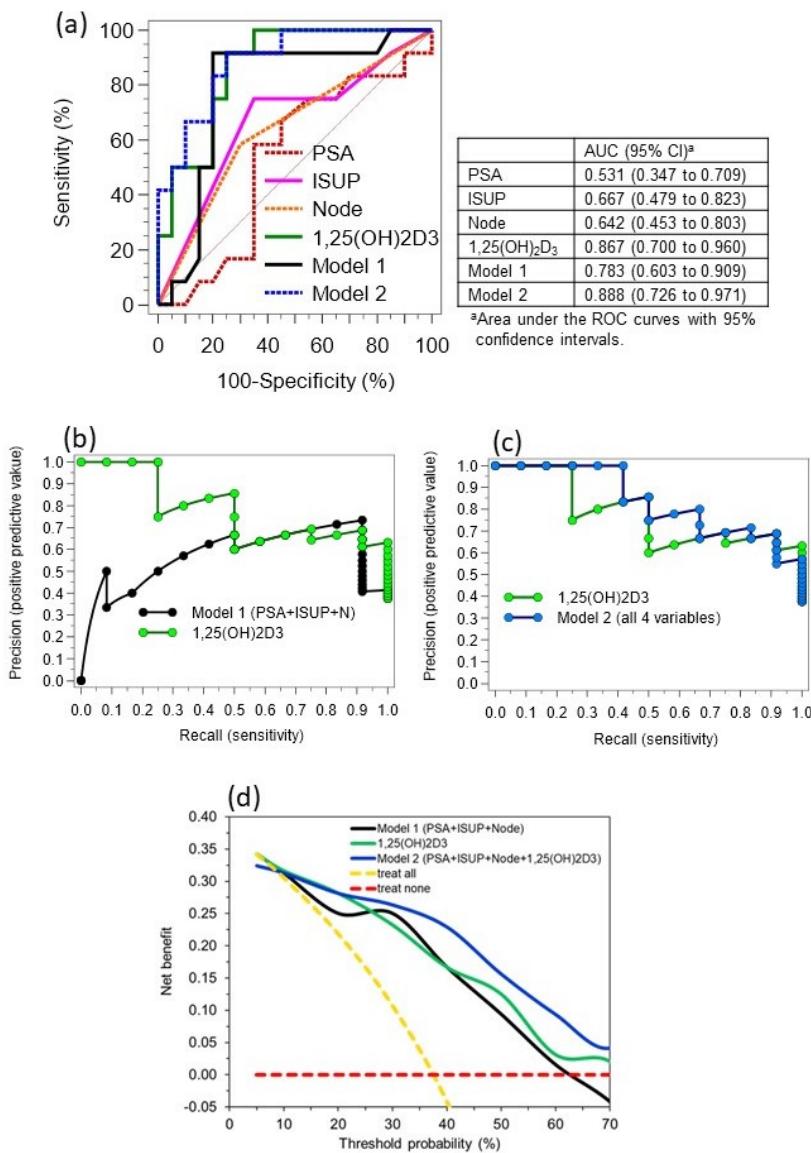

Figure S1. 1,25(OH)₂D₃ level as prognostic indicator of subsequent bone metastasis after radical prostatectomy. (a) Receiver-operating characteristic curve analysis (ROC), (b,c) Precision-recall curve analysis, and (d) Decision-curve analysis. The prognostic validity of 1,25(OH)₂D₃ is indicated as single marker in comparison with the separate clinicopathological factors prostate-specific antigen (PSA), Gleason scores as ISUP grade groups, and the Node (N) status as well as with the combination of these three variables (Model 1, calculated by binary logistic regression). Model 2 is based on all four variables (PSA, ISUP grade, Node status, and 1,25(OH)₂D₃).

Table S1. Clinicopathological risk factors of the study patients with and without zoledronic acid treatment and subsequent metastasis.

Pat_ID	PSA at diagnosis ($\mu\text{g/L}$)	Gleason score 1 + Gleason score 2	Node positive disease	Numer of risk factors	PSA before study entry ($\mu\text{g/L}$)	ZA treatment	Subsequent metastasis
D001	4	4+5	No	1	<0.03	No	No
