

Table S1. Review of the study literature evaluating the clinical impact of PSMA or FCH PET/CT-directed radiotherapy.

Authors (Only Retrospective study)	Patients number (lesions)	Disease Status	Median PSA before PET/CT (ng/mL)	Treatment received	Median follow up	Results
Mazzola et al. [31] 2021	88 (118)	Oligo-metastatic recurrence (≤ 3 lesions)	PSMA = 0.58 FCH = 2.04	Only SBRT without ADT	25 months	Longer ADT-FS in patients treated with SBRT guided by PSMA vs FCH → ADT-FS at 1 and 2 years: PSMA = 87.8% and 82.3% vs FCH = 73.2% and 63.8% (p=0.010).
Schmidt-Hegemann et Al. [33] 2020	272 (NA)	Persistent PSA after RP or 1 st BR	PSMA = 0.58 FCH = 0.6	Prostate bed RT ; Elective pelvic nodes RT ± boost ; Metastatic RT ; ± ADT associated (combination of several RT types)	30 months	No difference on BR-FS between PSMA or FCH RT guided → BR-FS at 1 and 2 years : PSMA = 63% and 55% vs FCH=73% and 63% (p=0.197). In multivariate analysis, V radiopharmaceutical used → High PSA level before PET/CT was a pejorative factor for BR-FS (p=0.024).
Deijen et Al. [32] 2021	50 (72)	Oligo-metastatic only (≤ 4 lesions)	PSMA = 1.8 FCH = 4.2	SBRT ± ADT associated	24.3 months	Longer ADT-FS if SBRT guided by PSMA vs FCH → Median ADT-FS PSMA = 32.7 months vs FCH = 14.9 months (p=0.010). In multivariate analysis, V radiopharmaceutical used → High PSA level before PET/CT was a pejorative factor for ADT-FS (p=0.025).
Our Study 2022	123 (204)	Bed prostate or oligo-metastatic recurrence (≤ 5 lesions)	PSMA = 0.48 FCH = 1.27	Prostate bed RT ± boost ; Elective node RT ± boost ; SBRT ; ± ADT associated (combination of several RT types)	42.2 months	Longer BR-FS if RT guided by PSMA vs FCH → median BR-FS PSMA = 24.7 months vs FCH = 13.0 months (p=0.008). Longer ADT-FS if RT guided by PSMA vs FCH → ADT-FS at 2 and 3 years PSMA = 75.9% et 65.5% vs FCH = 49.8% et 24.7% (p=0.001). In multivariate analysis, V radiopharmaceutical used → short PSA TD (p=0.005) and SBRT (p=0.001) were pejorative factors for BR-FS.
