

Supplementary data

Supplementary Figure S1. Correlation of SUV_{max} at 60 mins p.i. of [¹⁸F]FSPG vs. [¹⁸F]FDG, in HNSCC primary tumors (A), NSCLC primary tumors (B) and NSCLC metastatic lesions (C). Only one patient with HNSCC had a metastatic deposit. Lines of linear regression and 95% confidence levels (broken lines) are shown.

Supplementary Figure S2. Analysis of inter-observer readings (SUV_{max} as measured by Observer 1 vs Observer 2) demonstrated high correlation. All time points and patients were included. **(A)** NSCLC inter-observer correlation. Lines of linear regression and 95% confidence levels (broken lines) are shown. **(B)** Bland-Altman plots (difference vs average) of NSCLC. **(C)** HSNCC inter-observer correlation. Lines of linear regression and 95% confidence levels (broken lines) are shown. **(D)** Bland-Altman plot for HSNCC.
