

Supplemental Figure S1. Effect of tumor stages and polyp features on virus infections. The prevalence of HPV, HPyV and HHV (A, C) and of β -HPV infections and multiple infections (B, D) is shown for CRC patients (A, B) and subjects with AP (C, D) at the indicated tumor stages or polyp severity. Tumor stage was defined according to the TNM classification; high-risk polyps were defined as showing high-grade dysplasia, size greater than 10 mm or villous histology. Comparisons were performed using Fisher exact test.
