Figure S7. FT-IR spectra of as-made **V-MS-L** and **V-MS-L-cal** samples.

From the FT-IR spectra of as-made **V-MS-L** (**Figure S7**), the band at about 1490 cm^{-1} comes from the C-H bending ($\delta_{\text{C-H}}$) vibrations of surfactant, and the bands in the region of 2800 cm^{-1} to 3000 cm^{-1} are derived from the C-H stretching ($\nu_{\text{C-H}}$) vibrations of $-\text{CH}_3-$ and $-\text{CH}_2-$ in the surfactant; after calcination at $550\text{ }^{\circ}\text{C}$ for 6 h, these bands disappeared, indicating total removal of organic surfactant template. The band derived from Si-OH bond stretching vibration of the silanol groups at 960 cm^{-1} decreased after calcination due to condensation of silanol groups inside the pore walls during calcination. With increasing vanadium loading, bands between 1000 and 1200 cm^{-1} were enhanced due to the stretching vibration of $\text{V}=\text{O}$, [1,2] which overlaps with the Si-O-Si asymmetric stretching vibration.[3] The FT-IR spectra of vanadium-incorporated MCM-41 with Ti/Al/Zr/Ce anchors are all in accordance with the bands of **V-MS-L** and **V-MS-L-cal**.

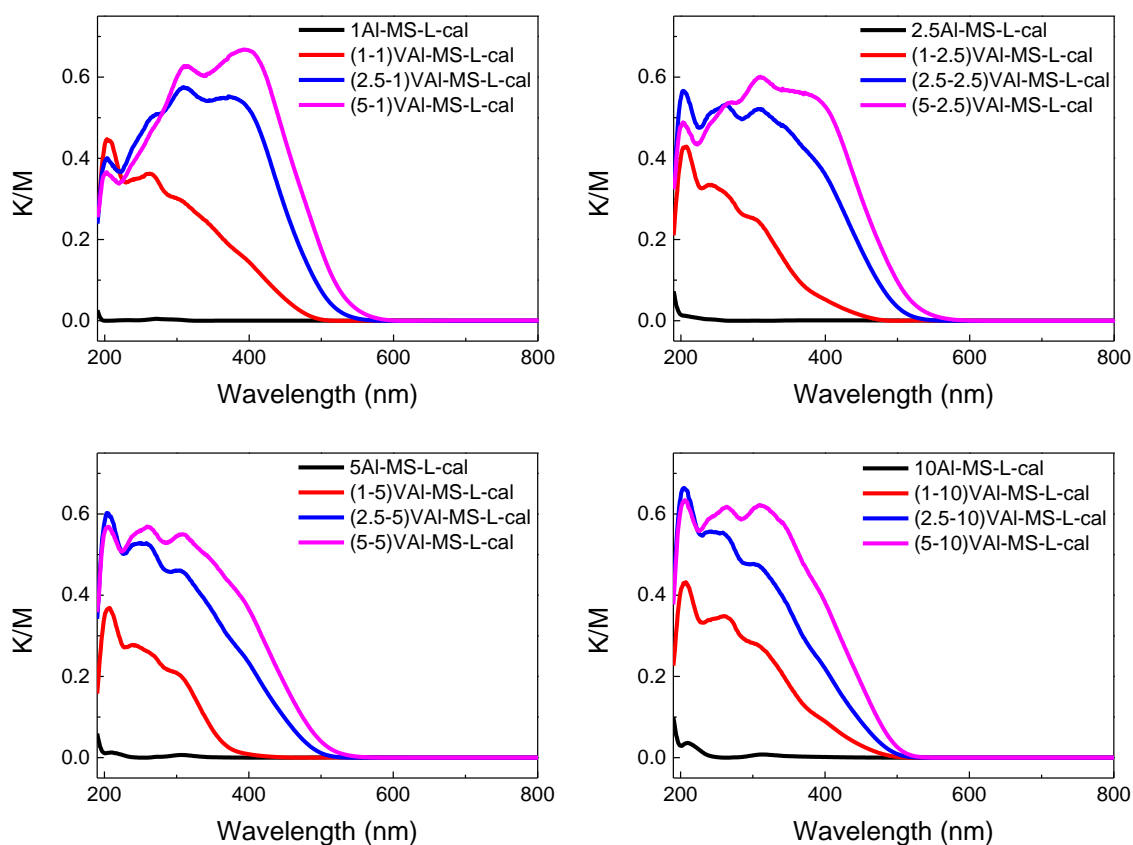

Figure S8a. UV-vis spectra of **VAl-MS-L-cal** samples.

MS-L-cal was used as blank, and before measurement, samples were diluted in **MS-L-cal** to keep the spectral intensity in the range of 0.2-0.8 Kubelka-Munk (K/M).

10	Pyridine	115	5.3	< 5	-
11	Ethanol (95 %)	78	4.3	< 5	-
12	H ₂ O (+MeCN)	100	10.2 (6.2)	< 5	-

Table S8. Recycling test of **(2.5-2.5)VAI-MS-L-cal** for 1,2-diphenyl-2-methoxyethanol oxidation in acetonitrile.

Catalysts	Conversion	Selectivity (%)				
	(%)	Benzaldehyde	Methyl benzoate	Methanol	Benzoic acid	Benzoin methyl ether
(2.5-2.5)VAI-MS-L-1st	49	84	10	6	0	0
(2.5-2.5)VAI-MS-L-2nd	46	81	12	4	0	3
(2.5-2.5)VAI-MS-L-3rd	43	79	13	5	0	3
(2.5-2.5)VAI-MS-L-4th	39	78	14	5	0	3
(2.5-2.5)VAI-MS-L-cal^a	32	76	19	0	0	5

a) After leaching in MeOH.
