^a: Underlined nucleotides are added to facilitate ligation-independent cloning into a pET46-Ek/LIC vector.

Supplemental Figure S1. Hydrolysis of birchwood xylan (BWX) by a single enzyme (TbXyn10A, TbXyl39A, TbXyl52A, TbHEOA, TbHEOB, TbAgu67A or TbAxe1A) in the gene cluster as analyzed by reducing sugar assay (A) and TLC (B). Five mg/mL of BWX was incubated with each enzyme (10 nM TbXyn10A, 10 nM TbXyl39A, 5 nM TbXyl52A, 100 nM TbAgu67A, 100 nM TbAxe1A, 100 nM TbHEOA or 100 nM TbHEOB) at 60 °C in a citrate buffer (pH 5.5) for 16 h, in the presence or absence of cofactors (1 mM NADH and 1 mM MnSO₄).

Supplemental Figure S2. Effects of redox-active cofactors and Mn²⁺ ion on the capacity of two new oxidoreductase-like proteins (TbHEOA and TbHEOB) to enhance hydrolysis of BWX by three enzymes mixture composed of TbXyn10A, TbXyl39A, and TbXyl52A. The end products were analyzed by reducing sugar assay (A) and TLC (B). Five mg/mL BWX was incubated with and without five enzymes mixture (10 nM TbXyn10A, 10 nM TbXyl39A, 5 nM TbXyl52A, 50 nM TbHEOA, and 50 nM TbHEOB) at 60 °C in a citrate buffer (pH 5.5) in the presence or absence of cofactors (1 mM NADH, 1 mM Mn²⁺ or 0.5 mM Re-glu) for 20 h. 5Es: 5 enzymes mixtures (TbXyn10A, TbXyl39A, TbXyl52A, TbHEOA, and TbHEOB). Other abbreviations were as follows: X1: xylose; X2: xyllobiose; X3: xylotriose; X4: xylotetraose; X5: xylopentaose; X6: xylohexaose.

Supplemental Figure S3. The synergistic effect of the seven enzymes encoded in the *T. bryantii* hemicellulase gene cluster during hydrolysis of heterogeneous xylans (A-E) and Miscanthus (F). The enzymatic reactions were carried out at 60 °C in a pH 5.5 citrate buffer supplemented with 1.0 mM NADH and 1.0 mM Mn²⁺. The substrates (BeeWX, BWX, LWX, and OSX) at 5 mg/mL were incubated with different combinations of the seven enzymes for 16 h. In the case of WAX, a lower concentration of substrate (2.5 mg/mL) was incubated with a lower concentration of enzymes (5 nM TbXyn10A, 5 nM TbXyl39A, 2.5 nM TbXyl52A, 50 nM TbAgu67A, 50 nM TbAxe1A, 25 nM TbHEOA, and 25 nM TbHEOB) for 16 h. Miscanthus was incubated at a higher concentration of substrate loading (10 mg/mL) with higher concentrations of enzymes (1 μM TbXyn10A, 0.5 μM TbXyl39A, 0.5 μM TbXyl52A, 2 μM TbHEOA, 2 μM TbHEOB, 2 μM TbAgu67A, and 2 μM TbAxe1A) for a longer period of 21 h. The end products were analyzed by TLC. (B): is a control of substrate without enzyme.

Supplemental Figure S5. Multiple sequence alignment using Clustal Omega of the two HEOs from *T. bryantii* with putative functional homologs occurring as adjacent genes in other bacteria. GenBank accession numbers of the oxidoreductase-like proteins are the same as listed in Supplemental Table 5. The amino acids are shaded based on conservation. Residues with 50% or more identity in the aligned sequences are shaded in black. Amino acids with similar properties (grouped as GAVLI, FYW, CM, ST, KRH, DENQ, P) in 50% or more of the aligned sequences are shaded in grey.
