

Supplementary information

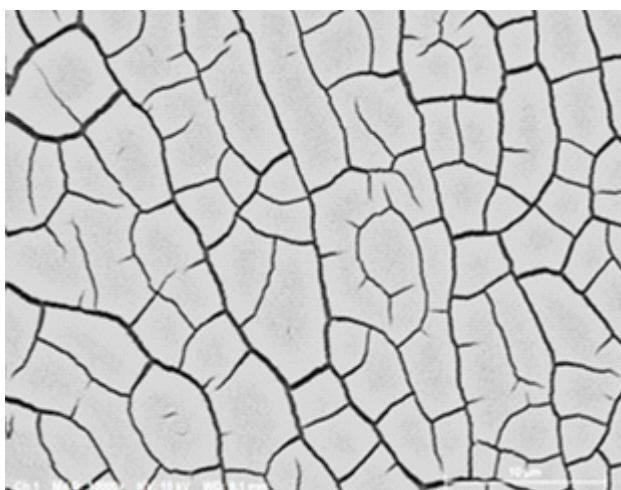

(a)

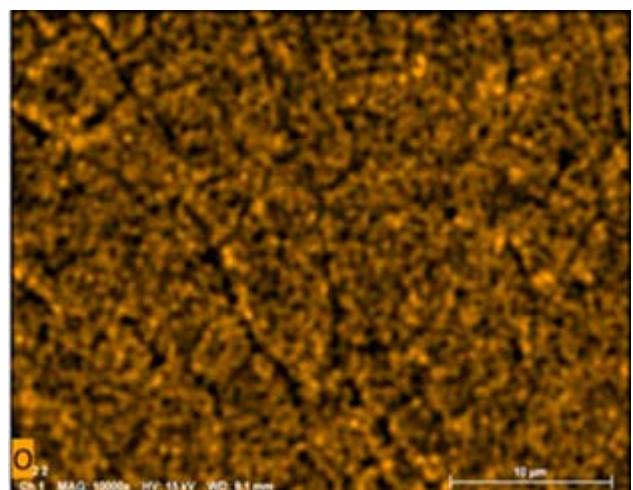

(b)

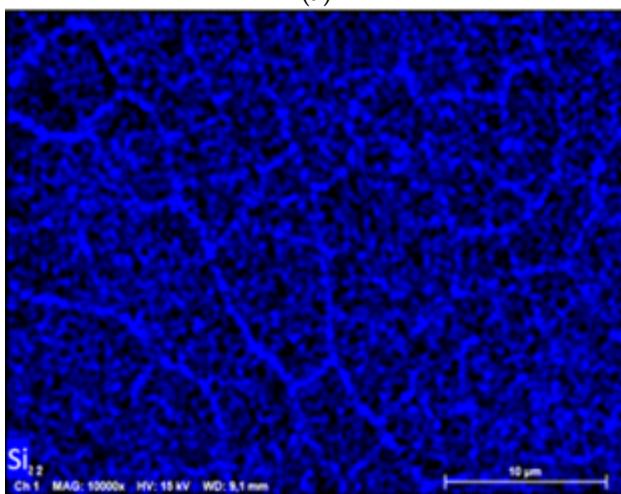

Figure S1. Top-view SEM analyses of the TiO₂ coating on glass samples as deposited (a) and after annealing at 500 °C for 2 hours (b). It is possible to notice in both samples that there are some areas in which the TiO₂ coating is lacking.

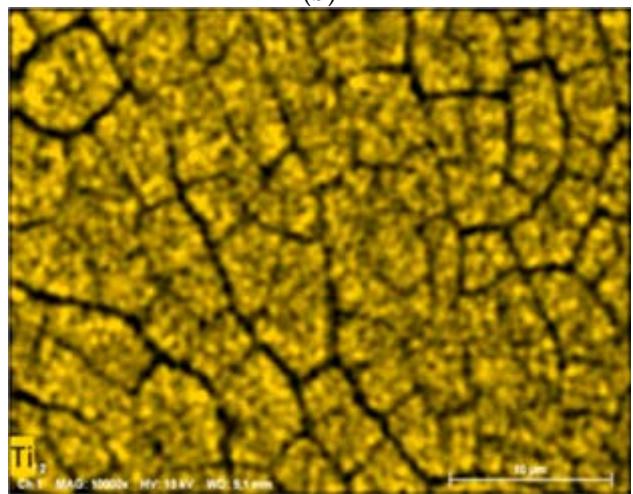

(a)

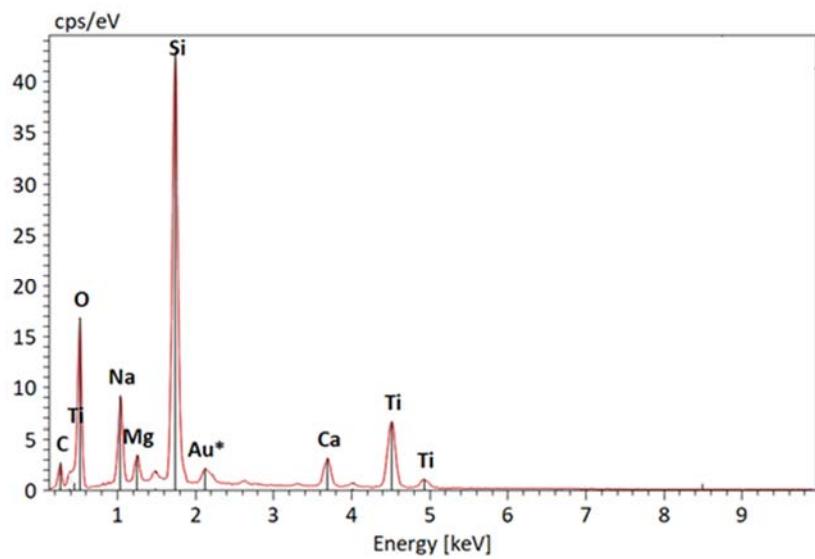

(b)

(c)

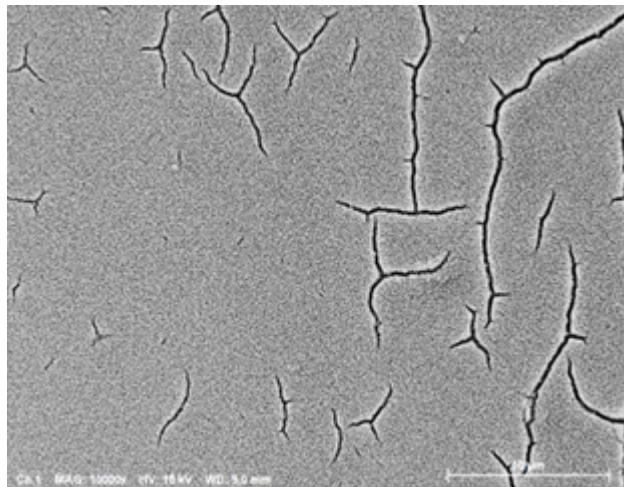

(d)

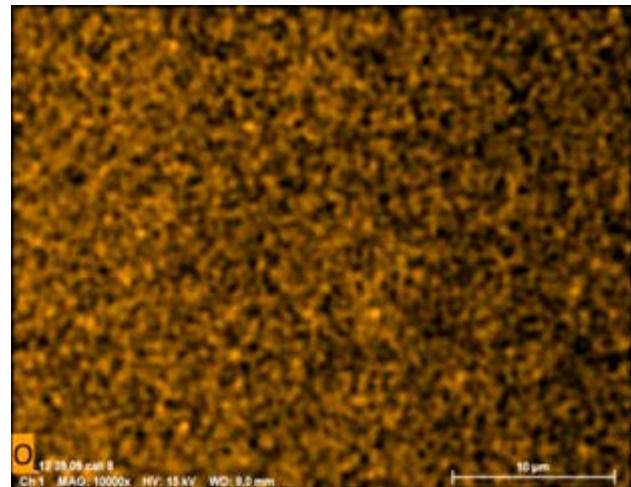

(e)

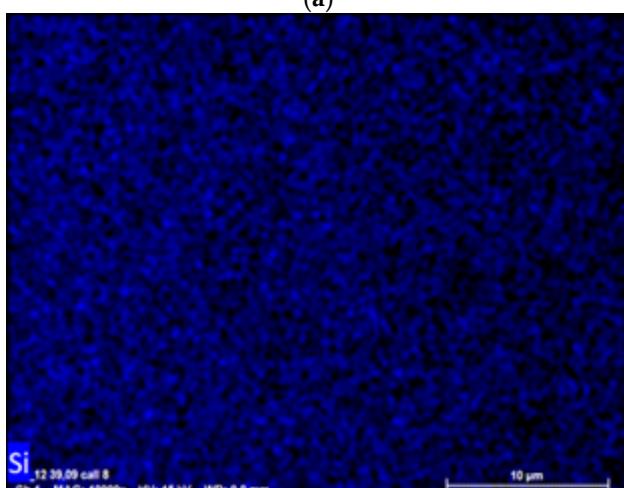

Figure S2. (a) Top-view SEM analysis of the TiO_2 coating on glass substrate as deposited. (b) EDS oxygen map. (c) EDS silicon map. (d) EDS titanium map. (e) EDS analysis of the area shown in (a).

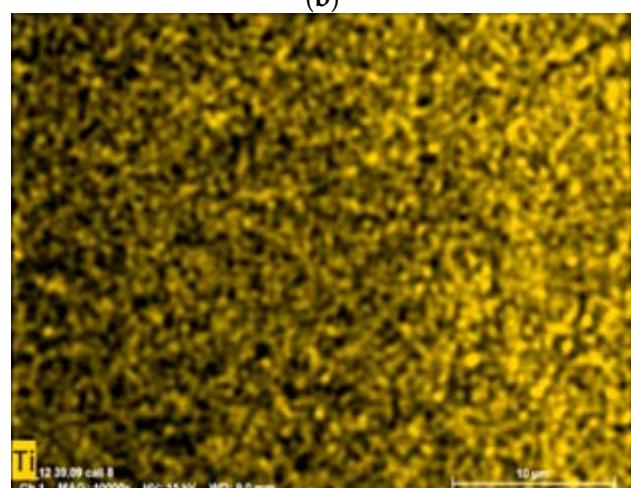

(a)

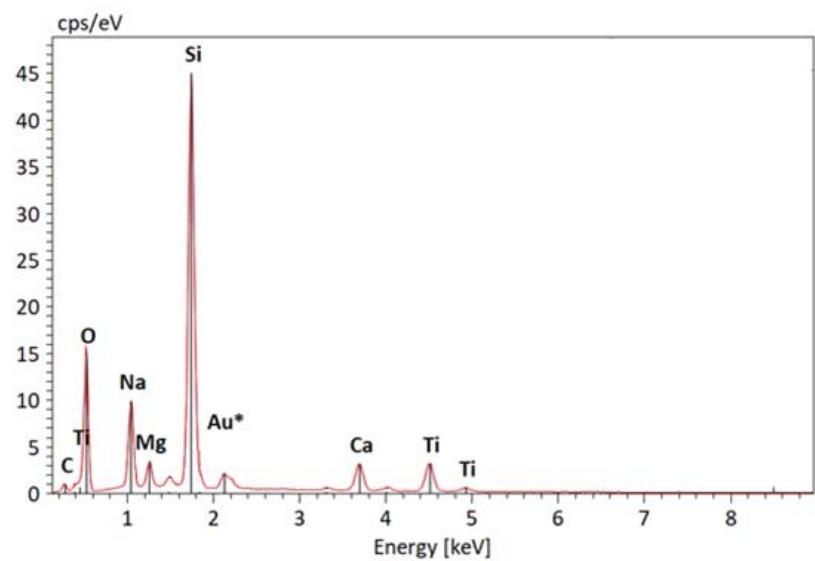

(b)

(c)

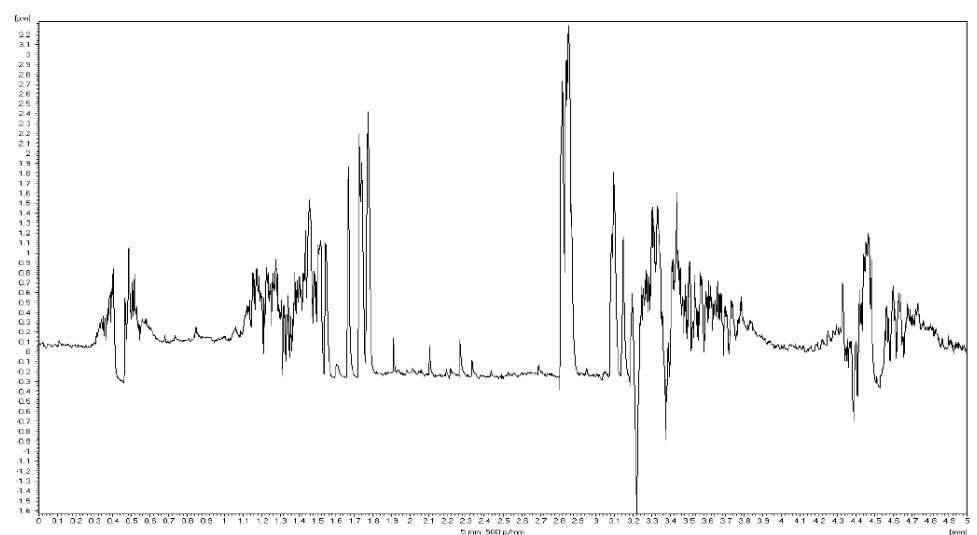

(d)

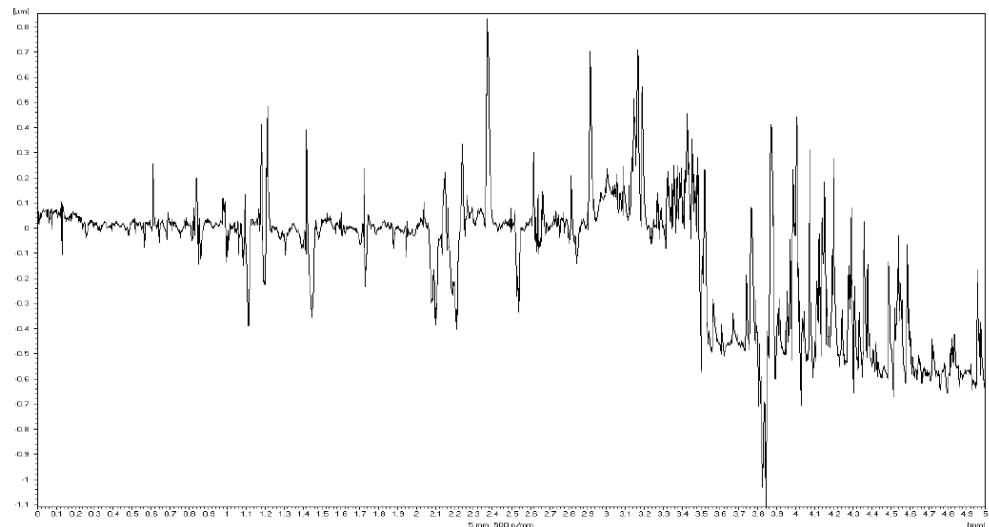

(e)

Figure S3. (a) Top-view SEM analysis of the TiO_2 coating on glass substrate after annealing at 500 $^{\circ}\text{C}$ for 2 hours. (b) EDS oxygen map. (c) EDS silicon map. (d) EDS titanium map. (e) EDS analysis of the area shown in (a).

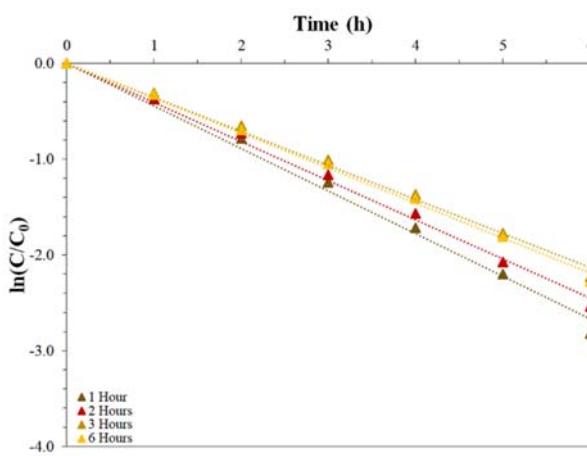

(a)

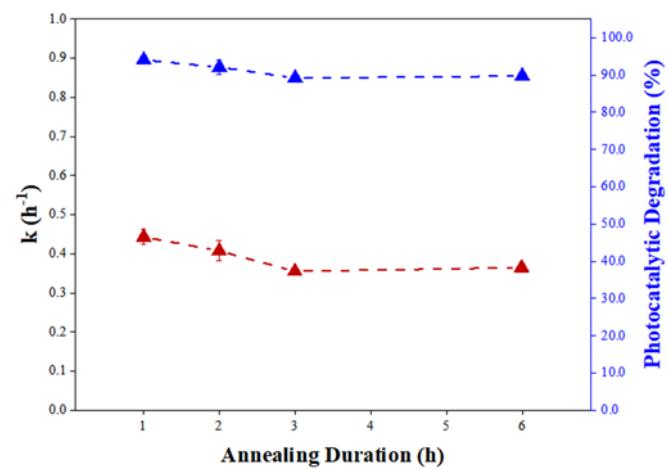

(b)

Figure S4. Laser profilometry on coated glass samples as deposited (a) and after annealing at 500 °C for 2 h (b).

(a)

(b)

Figure S5. (a) Kinetics of RhB photocatalytic degradation for different annealing durations. (b) Effect of annealing duration on the photocatalysis kinetics and on the photocatalytic degradation percentage.

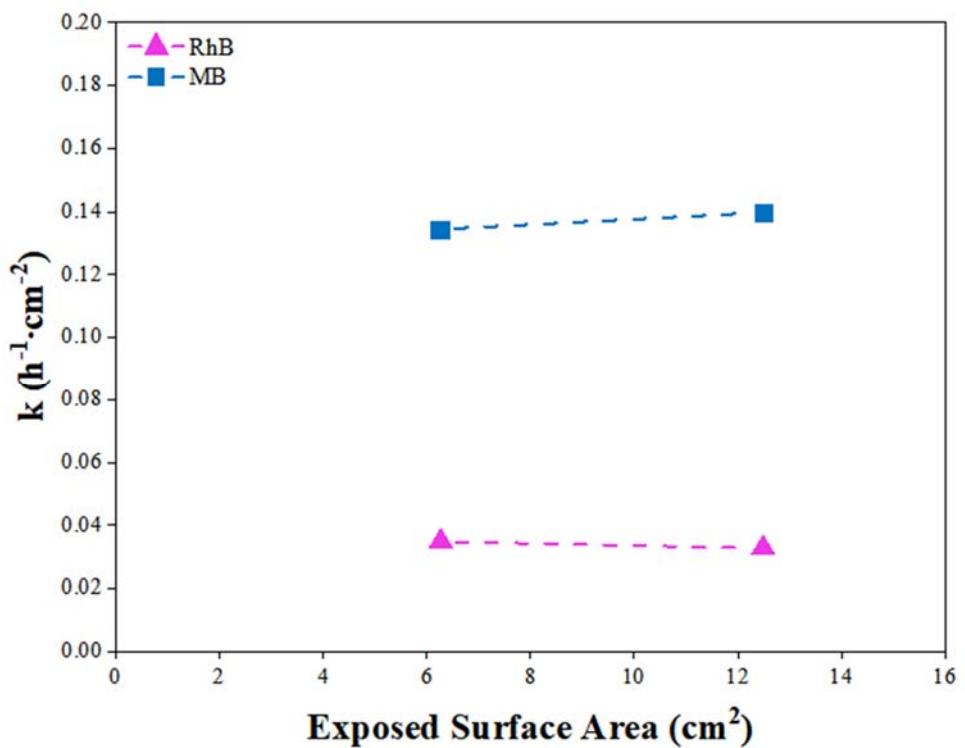

Figure S6. Effect of coated sides on the photocatalysis kinetics of RhB and MB per unit of area.

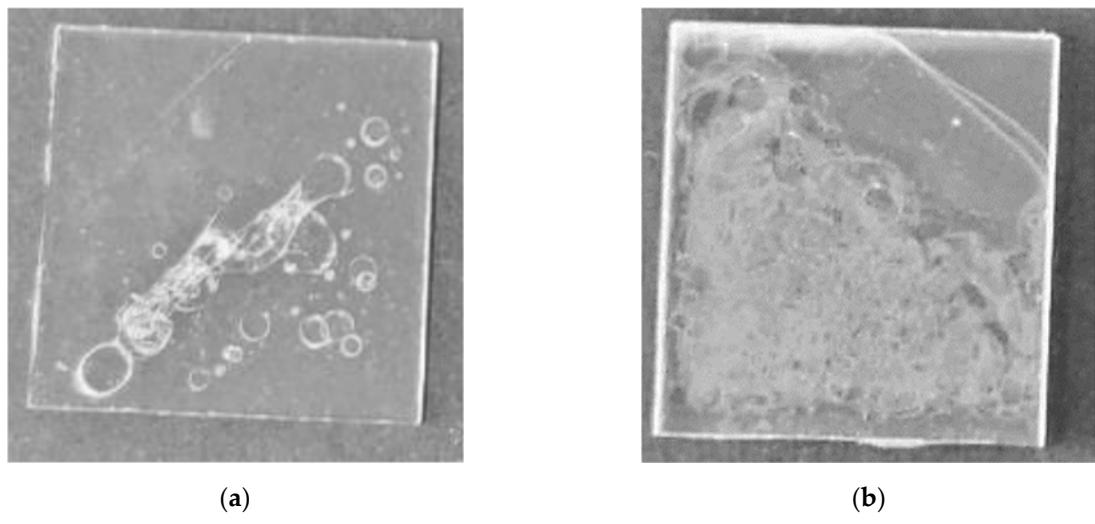

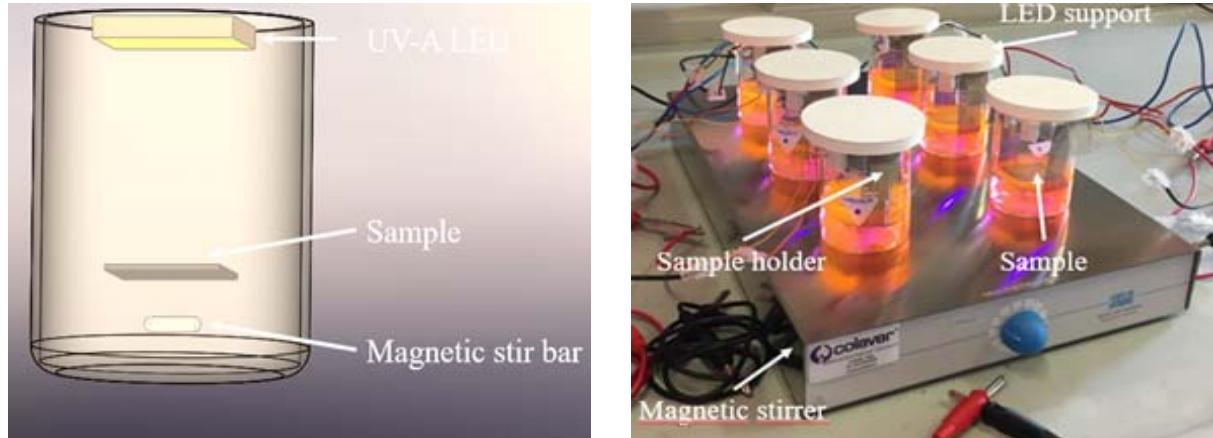

Figure S7. Visual aspect of TiO_2 coatings on glass substrate as deposited (a) and after annealing (b)

(a)

(b)

Figure S8. (a) Schematic representation of the batch reactor used in the present research. (b) Photo of the batch reactor used in the present research.

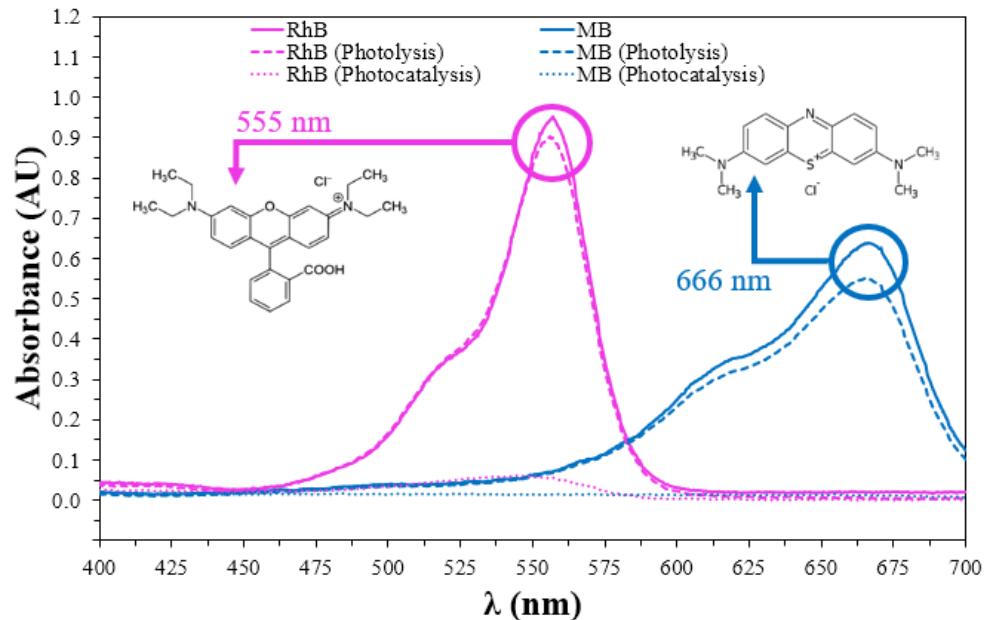

Figure S9. Absorbance spectra of aqueous single-dye solutions (10^{-5} M) in the visible range before the degradation process, after 6 hours of photolysis and after 6 hours of photocatalysis under UV-A light. The impact of the photolysis process on the total photodegradation process is about 0.9% for RhB and 1.6% for MB.

Table S1. Measured colorimetric parameters for different number of dips. The condition selected as reference is reported underlined.
