

Role of Solvent (THF) in H₂-Splitting Barrier

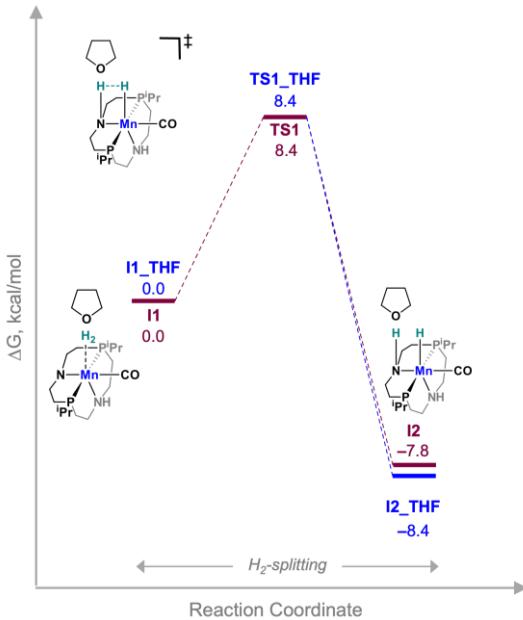

Figure S1. Role of explicit solvent (THF) on the H₂-splitting barrier of 2_{Mn}.

Conformational Analysis of 2_{Mn} and 3_{Fe}

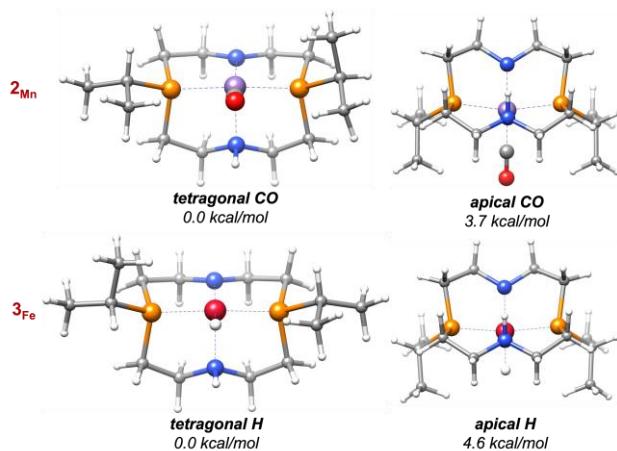

Figure S2. Different conformers of 2_{Mn} and 3_{Fe} along with their relative energies computed at the DFT- ω B97xD level of theory.

Calculation of Hydricity ($\Delta G^{\circ}_{H^-}$)

For the calculation of thermodynamic hydricities of the metal–hydride intermediate (**I2**), we used a solvent–dependent protocol developed by Muckerman et. al. [44] Hydricity ($\Delta G^{\circ}_{H^-}$) of a metal–hydride intermediate (MH) can be defined as the standard free energy change of the reaction,

Therefore, mathematically, the hydricity of the metal–hydride intermediates ($\Delta G^{\circ}_{H^-}$) can be expressed as:

$$\Delta G^{\circ}_{H^-} = G^{\circ}(M^+) + G^{\circ}(H^-) - G^{\circ}(MH) \dots\dots\dots (1)$$

To overcome the challenge of calculating the absolute free energy of a solvated hydride, $G^{\circ}(H^-)$, Muckerman et. al. proposed a protocol based on hydricity–half–reaction (HHR) as follows,

and by calculating its corresponding standard free energy change $\Delta G^{\circ}_{HHR}(MH)$.

$$\Delta G^{\circ}_{HHR}(MH) = G^{\circ}(M^+) - G^{\circ}(MH) = \Delta G^{\circ}_{H^-} - G^{\circ}(H^-) \dots\dots\dots (2)$$

Thus, the experimentally determined hydricity $\Delta G^{\circ}_{H^-}(\text{expt.})$ changes linearly with the hydricity–half–reaction $\Delta G^{\circ}_{HHR}(\text{expt.})$ giving a unit slope and an intercept which is basically the absolute free energy of a solvated hydride($G^{\circ}(H^-)$). By using this protocol, it is, therefore, possible to calculate the HHR free energy change $\Delta G^{\circ}_{HHR}(\text{calc.})$ of a series of species whose hydricities are known experimentally.

In this work, to set up our linear fit equation, we choose already existing six different metal–hydride donor species whose hydricities were determined experimentally. Along with these six species, we have considered formate ($HCOO^-$) to match our theoretical $\Delta G^{\circ}_{H^-}(CO_2)$ value with its experimentally reported value.

Table S1. Experimental hydricities for the training set.

| Species | $\Delta G^{\circ}_{H^-}(\text{expt.})$ (kcal/mol) | References |
|---------------------------|---|------------|
| $HCOO^-$ | 43 | 44 |
| Ph_3CH | 99 | 45 |
| BNAH ^a | 59 | 46 |
| $[Pt(dmpp)H]^+$ | 50.7 | 47 |
| $[Ni(dmpp)H]^+$ | 62.1 | 47 |
| $p-(Me_2NC_6H_4)_3CH$ | 74 | 45 |
| $(SiP^{iPr}_3)Fe(H_2)(H)$ | 54.3 | 48 |

^aBNAH: 1–benzyl–1,4–dihydronicotinamide; ^bdmpp: bis(dimethylphosphino)propane

Now, the DFT– ω B97XD calculated values of ΔG°_{HHR} in acetonitrile solvent are plotted against the experimental hydricities $\Delta G^{\circ}_{H^-}$ in Figure S3.

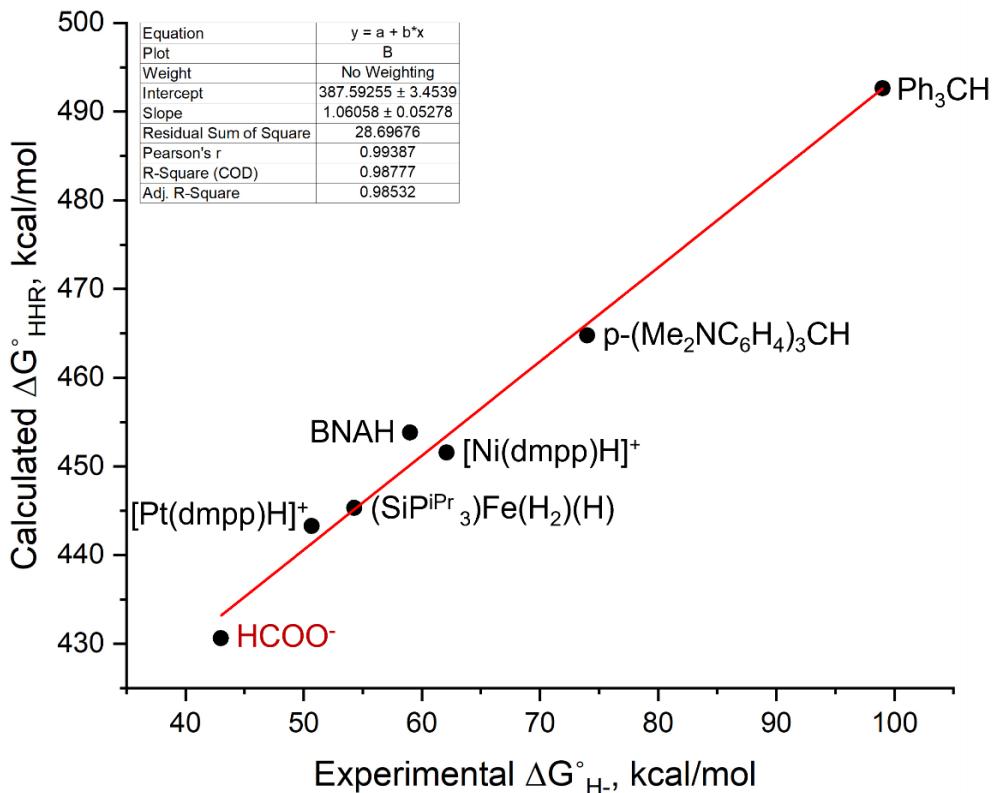

Figure S3. Correlation plot between calculated $\Delta G^{\circ}_{\text{HHR}}$ and experimental $\Delta G^{\circ}_{\text{H-}}$ of seven different species.

Figure S3 gives rise to the linear-fit equation, $\Delta G^{\circ}_{\text{HHR}} = 387.6 + 1.06 \cdot \Delta G^{\circ}_{\text{H-}}$ following which the hydricities of the species of our interest have been calculated, which are tabulated in Table S2.

Table S2. Calculated hydricities ($\Delta G^{\circ}_{\text{H-}}$ in kcal/mol) for all the species involved

| Species | Hydricity |
|-----------------------|-----------|
| 1_{Mn} | 55.2 |
| 2_{Mn} | 47.1 |
| 3_{Fe} | 48.7 |

Our calculation shows an uncertainty of about ± 3.5 kcal/mol in $\Delta G^{\circ}_{\text{HHR}}$ in calculating absolute hydricity values which are clearly seen in Figure S3. This indicates that the level of theory and the solvation model plays a crucial role in the calculation of $\Delta G^{\circ}_{\text{HHR}}$ values significantly which was predicted earlier by Muckerman et.al. But, this absolute error in the calculated hydricity can be neglected as we are mainly focusing on the relative hydricity of the reported species as we are concerned about the reactivity of that complexes towards the CO₂ hydrogenation reaction.

Table S3. Calculated hydricity and overall barriers for H₂ splitting and hydride transfer step.

| Species | Calculated Hydricity ($\Delta G_{H^-}^\circ$, kcal/mol) | Overall H ₂ -Splitting Barrier (ΔG^\ddagger , kcal/mol) | Overall Hydride Transfer Barrier (ΔG^\ddagger , kcal/mol) |
|-----------------|--|--|---|
| 1 _{Mn} | 55.2 | 14.6 | 11.5 |
| 2 _{Mn} | 47.1 | 10.0 | 7.4 |
| 3 _{Fe} | 48.7 | 9.9 | 8.1 |

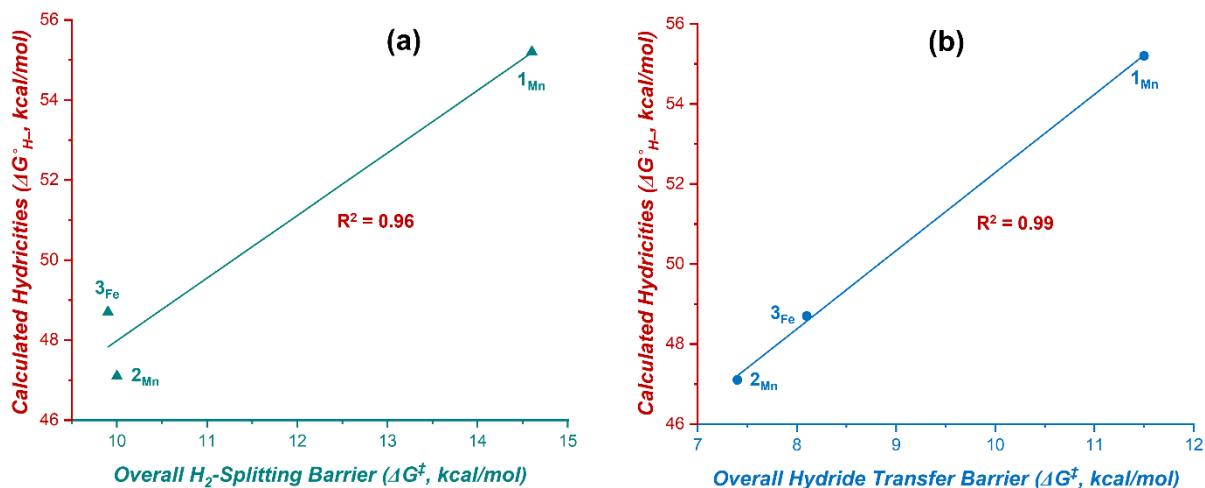

Figure S4. Correlation plot between the “overall” free energy barrier of the key steps of CO₂ hydrogenation and calculated hydricities of the metal–hydride intermediates obtained at the DFT-
ωB97xD level. (a) H₂ splitting (b) hydride transfer.

Table S3 collects the free energy barriers for the two key steps of CO₂ hydrogenation, that is, H₂ splitting and hydride transfer calculated relative to the separated reactants for the three complexes 1_{Mn}, 2_{Mn}, and 3_{Fe}. These “overall” free energy barriers are marked in the reaction free energy profiles presented in Figures 1, 2, and 3 in the main text. Although very good correlations, $R^2 = 0.96$ for H₂-splitting (Figure S4a) and $R^2 = 0.99$ for hydride transfer (Figure S4b), were observed between the calculated hydricity and overall free energy barriers, the correlation for the H₂ splitting step yields a positive slope. This implies that the metal–hydride intermediate possessing a lower hydricity exhibits a lower H₂ splitting barrier and vice versa. At the same time, the hydride transfer step also shows a positive correlation (Figure S4b), suggesting a similar electronic requirement for both steps. This doesn’t corroborate the established opposite electronic structure requirement of the two key steps of CO₂ hydrogenation. [30,36,37] Therefore, we considered the “intrinsic” free energy barriers, the barriers computed using the H₂ and CO₂ bound species, I1 and I3 as the reference to generate the correlation plots. This gives thermodynamic correlations that appropriately reflect the opposite electronic requirements of the key reaction steps: negative correlation for the H₂ splitting step (Figure S5a) and positive correlation for the

hydride transfer step (Figure S5b). The unexpected correlation observed with the “overall” barrier might be due to the uncertainties (e.g., different spin states of the free catalyst, error in entropy contribution) associated with the barriers calculated from separated reactants.

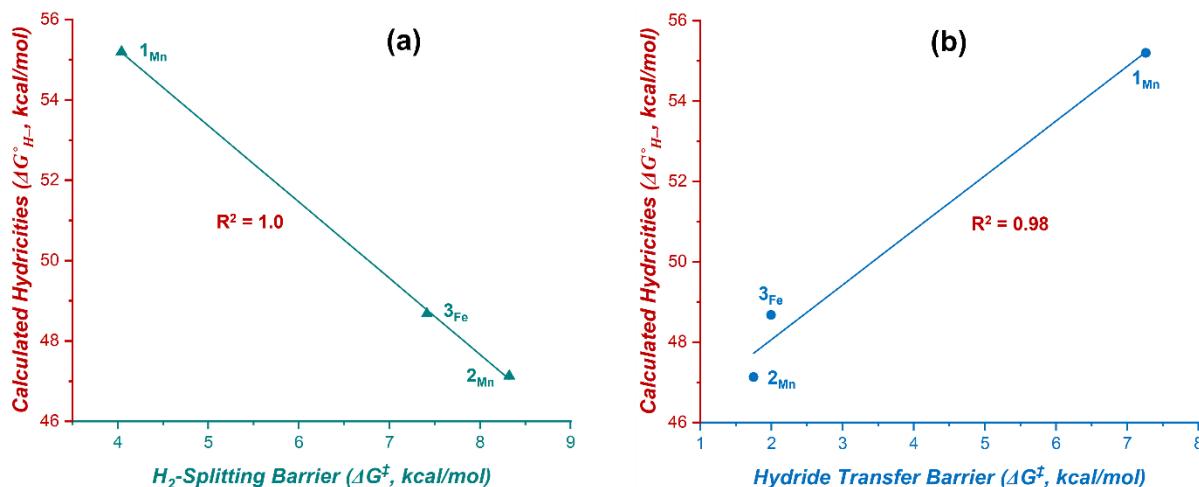

Figure S5. Correlation plot between the “intrinsic” free energy barrier of the key steps of CO_2 hydrogenation and calculated hydricities of the metal–hydride intermediates obtained at the DFT– ωB97xD level. (a) H_2 splitting (b) hydride transfer.

Table S4. Optimized Cartesian Coordinates for the Species Involved.
