

Figure S6: MSC secretome presented a cytoprotective effect in HepaRG cells incubated with TMX. Optical microscopic observation of the cytoprotective effect of MSC secretome on HepaRG cells exposed to TMX (15 and 20 μM), alone or coincubated with MSC secretome (20 μg/ml) for 24 hours. As control group, cells were incubated with the drug solvent (0.5% DMSO). Representative micrograph of three independent experiments. Bars represent 100μm.
