* value is significant after Bonferroni's correction (p -value = 0.0006).

Table S4 – Analysis of Molecular Variance (AMOVA) to evaluate the partitioning of genetic variation (structure) among different sampling schemes, based on a pairwise distance matrix between samples.

Source of Variation	d. f.	Sum of Squares	Variance Components	Percentage of Genetic Variation
Among sub-basins	9	115380.930	944.36407	43.98*
Among locations within sub-basins	3	7107.994	215.26808	10.02*
Among individuals within locations	44	19355.233	-547.80855	-25.51
within individuals	57	87524.000	1535.50877	71.51*
Total	113	229368.158	2147.33237	

* significant at 0.05 p-level.

Table S5 –Average Model evaluation using True skill statistic (TSS) for each of the algorithms and modelled taxa.

	<i>U. tumidiformis</i>		<i>Squalius</i>	
Models*	Average	SE	Average	SE
SRE	0.792	0.030	0.77	0.01
CTA	0.962	0.017	0.98	0.00
RF	0.999	0.000	0.99	0.00
FDA	0.992	0.001	0.96	0.00
GLM	0.989	0.005	0.97	0.01
GBM	0.993	0.003	0.98	0.00
GAM	0.990	0.007	0.99	0.00
ANN	0.997	0.001	0.99	0.00
Average	0.96	0.01	0.95	0.00

* Models computed: GLM (generalized linear model), GAM (generalized additive model), CTA (classification tree analysis), FDA (flexible discriminant analysis), ANN (artificial neural networks), RF (random forest for classification and regression), GBM (generalized boosted regression model) and SRE (surface range envelope).

Table S6 – Percentage of suitable and unsuitable areas in the Iberian Peninsula for the selected taxa and the modeled timeframes and shared socioeconomic pathways (SSPs).

Species	Timeframe	SSP	Suitable (%)	Unsuitable (%)	% reduction*
<i>Unio tumidiformis</i>	Present		7.17	92.83	
	2021-2040	245	0.11	99.89	99
	2021-2040	585	0.06	99.94	99
<i>Squalius</i>	Present		87.07	12.93	
	2021-2040	245	81.37	18.63	19
	2021-2040	585	79.40	20.60	21
	2041-2060	245	67.30	32.70	33
	2061-2080	245	58.54	41.46	42
	2081-2100	245	79.16	20.84	21

* Percentage reduction of suitable areas for each timeframe modelled when compared with current predictions.

Figure S1. Cross-entropy for each number of K ancestral populations inferred with sNMF.

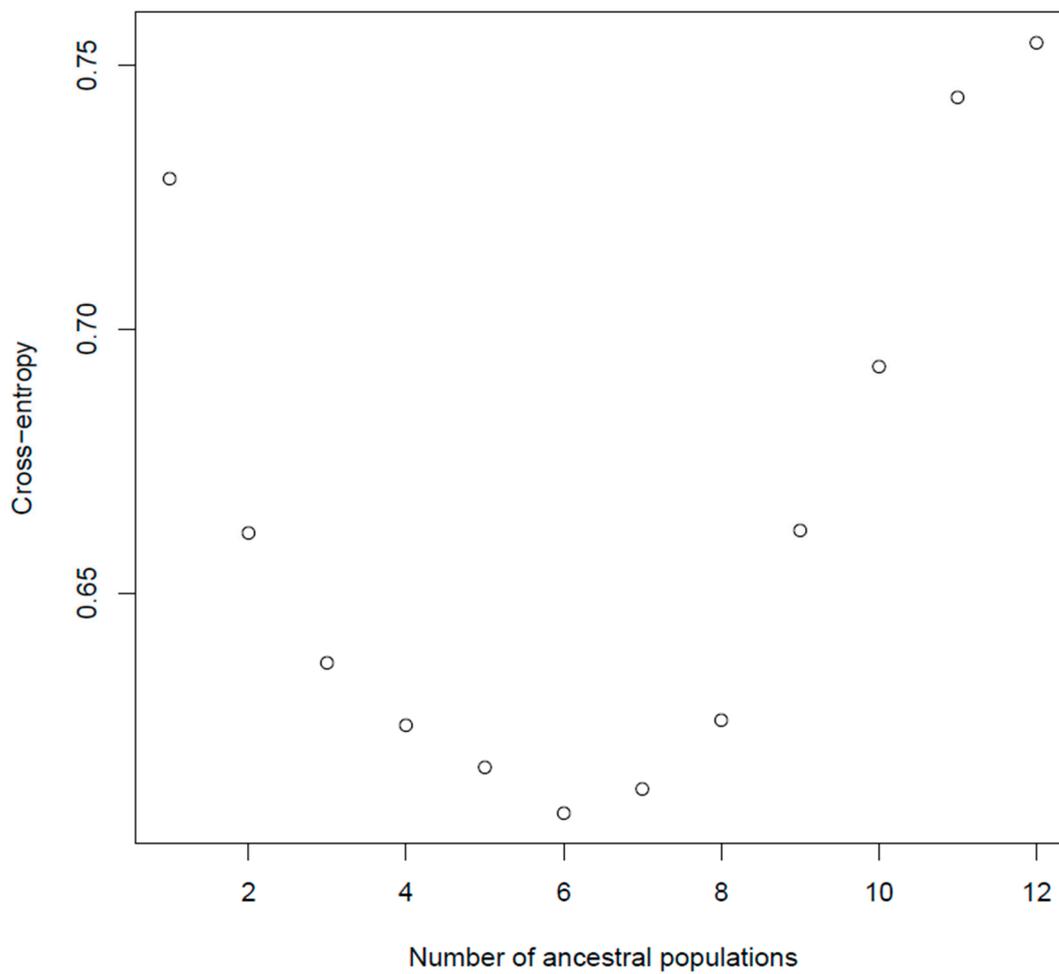

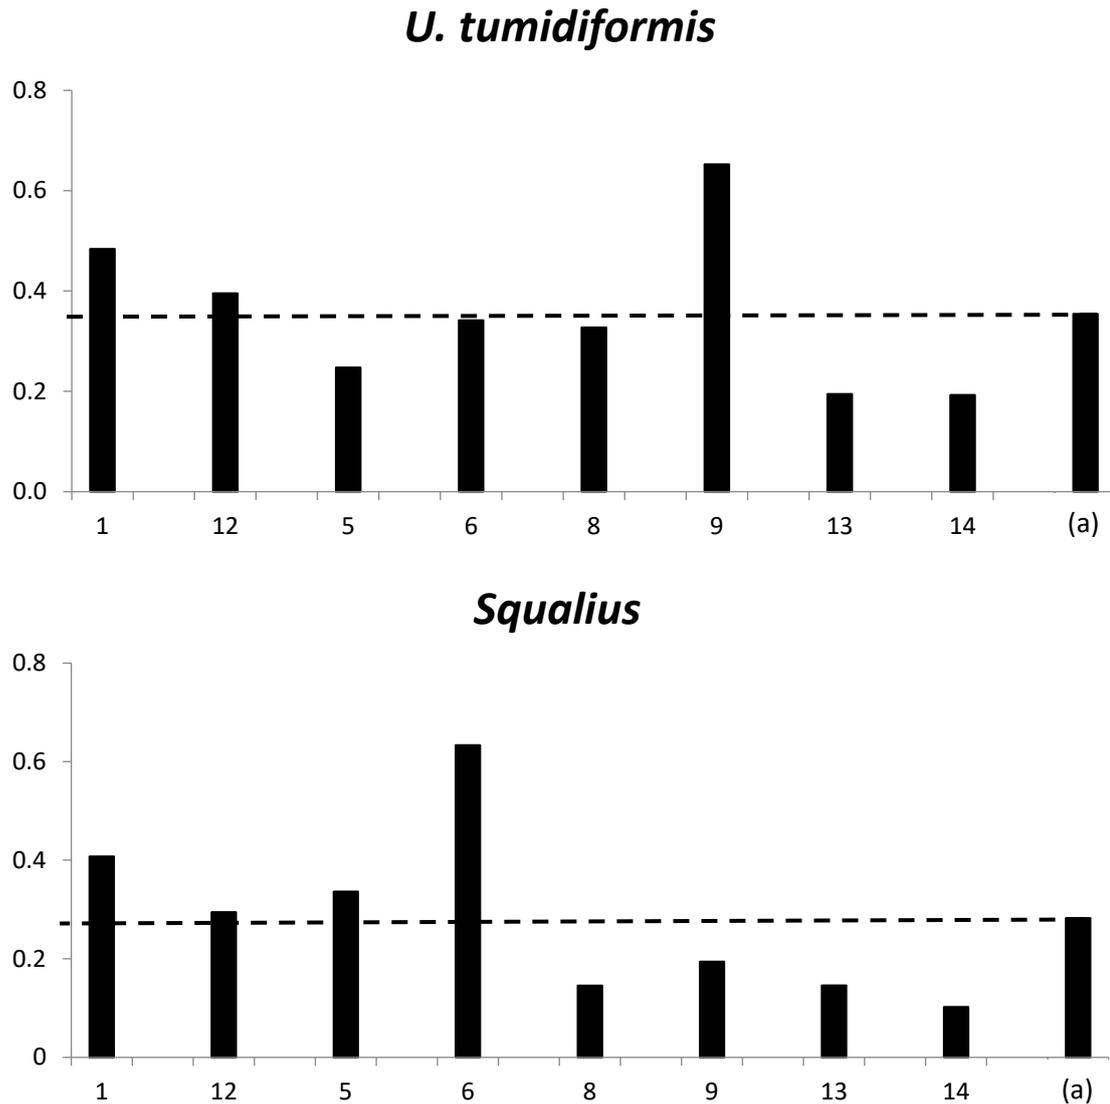

Figure S2 - Relative importance of the eight environmental variables (BIO1 = Annual Mean Temperature; BIO12 = Annual Precipitation; BIO5 = Max Temperature of Warmest Month; BIO6 = Min Temperature of Coldest Month; BIO8 = Mean Temperature of Wettest Quarter; BIO9 = Mean Temperature of Driest Quarter; BIO13 = Precipitation of Wettest Month; BIO14 = Precipitation of Driest Month) used to predict the distribution of *U. tumidiformis* and its hosts.

(a) The last column represents the mean value of relative importance obtained from eight different modelling algorithms. Individual variables with relative importance above this value (dashed line) were assumed as important in determining suitability according to the models used.
