

SUPPLEMENTARY MATERIAL

Figure S1. Patients' flow-chart.

Diagnosis was suspected but not proven when swabs results were doubtful and was not possible to obtain a certain diagnosis in ED, or when patients died at admission before performing COVID-19 swab. Even if these patients showed typical signs and symptoms or chest imaging suggestive for COVID-19 disease, they were excluded from further analysis due to uncertain diagnosis. For negative controls, mismatch between swab results and serum immunoglobulin tests was intended as negative swab with SARS-CoV-2 IgM and/or IgG found positive. These patients were unlikely to be considered totally COVID-19 free and were excluded.

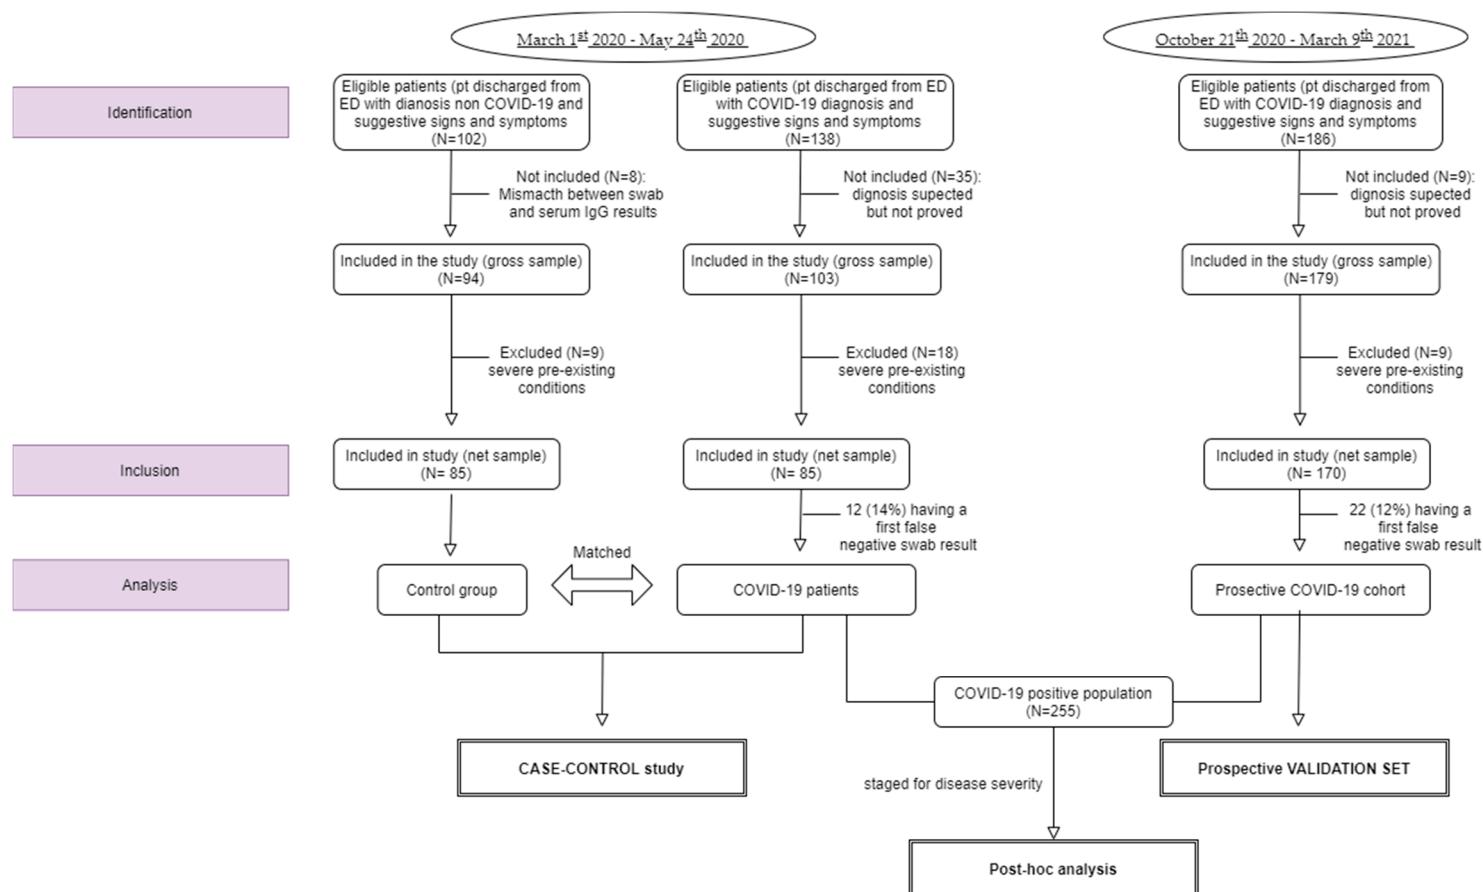

Table S1. Etiology of admission in ED of control group. COPD, chronic obstructive pulmonary disease; URTI, Upper respiratory tract infections; ORL, otorhinolaryngological; CNS, central nervous system; EBM, Epstein-Barr virus; CMV, cytomegalovirus; UTI, urinary tract infection.

Symptoms of admission (% on 85 controls)	Etiology	Frequency (n)	Percent (%)
Dyspnea (40%)	Pneumotorax	2	5,9
	Non cardiogenic pulmonary edema	3	8,8
	Pain attack	1	2,9

Table S3. Kendall's tau B non-parametric bivariate correlation. Correlation coefficients between the analysed haematological 2yparameters and COVID-19, where a coefficient = 1 indicates a perfect positive correlation. All values examined were statistically significant at a 2-tailed P-value < 0.001. The cut-offs used are standard laboratory cut-offs where available and thresholds found through ROC curve analysis for eosinophil percentage and absolute count, NLR, WLR, and DELR.
